Notice of Preparation

Notice of Preparation

To: State Clearinghouse
Santa Clara County Clerk
(Address)

From: City of Mountain View Planning Department
500 Castro Street
Mountain View, CA 94039
(Address)

Subject: Notice of Preparation of a Draft Environmental Impact Report

The City of Mountain View will be the Lead Agency and will prepare an environmental impact report for the project identified below. We need to know the views of your agency as to the scope and content of the environmental information which is germane to your agency's statutory responsibilities in connection with the proposed project. Your agency will need to use the EIR prepared by our agency when considering your permit or other approval for the project.

The project description, location, and the potential environmental effects are contained in the attached materials. A copy of the Initial Study (is is not) attached.

Due to the time limits mandated by State law, your response must be sent at the earliest possible date but not later than 30 days after receipt of this notice.

Please send your response to Margaret Netto, Planner at the address shown above. We will need the name for a contact person in your agency.

Project Title: The Village at San Antonio Center Phase II

Project Applicant, if any: Merlone Geier Partners

Date 8/14/13

Signature 

Title Planner

Telephone 650-903-6452

Reference: California Code of Regulations, Title 14, (CEQA Guidelines) Sections 15082(a), 15103, 15375.

To: State Agencies
Responsible Agencies
Local and Public Agencies
Trustee Agencies
Interested Parties

From: Margaret Netto, Planner

Mountain View, CA 94041

**NOTICE OF PREPARATION OF AN ENVIRONMENTAL IMPACT REPORT
FOR THE VILLAGE AT SAN ANTONIO CENTER - PHASE 2 PROJECT**

As the Lead Agency, the City of Mountain View will prepare an Environmental Impact Report (EIR) for the above referenced project and would like your views regarding the scope and content of the environmental information to be addressed in the EIR. This EIR may be used by your agency when considering approvals for this project. The project description, location, and a brief summary of potential environmental effects are attached.

A Public Scoping Meeting will be held on August 28, 2013 at 4:00 p.m. to take comments regarding the scope and content of the Draft EIR. The Scoping Meeting will be held at Mountain View City Hall, 500 Castro Street, in the City Council Chambers.

According to State law, the deadline for your response is 30 days after receipt of this notice; however, we would appreciate an earlier response, if possible. Written comments will be accepted until Friday, September 20, 2013 at 5:00 p.m. Please identify a contact person, and send your response to:

City of Mountain View
Community Development Department

Ms. Margaret Netto
Planning Division
City of Mountain View
500 Castro Street
Mountain View, CA 94039-7540

Dear Ms. Netto:

Village at San Antonio Center, Phase 2 – NOP

Thank you for including the California Department of Transportation (Caltrans) in the environmental review process for the project referenced above. We have reviewed the Notice of Preparation (NOP) and have the following comments to offer.

Traffic Impact Study (TIS)

One of Caltrans' ongoing responsibilities is to collaborate with local agencies to avoid, eliminate, or reduce to insignificance potential adverse impacts by local development on State highways. We have concerns about the resulting traffic impacts from this project on adjacent and vicinity intersections, including El Camino Real/State Route (SR) 82. We request that the environmental document for the project include a Traffic Impact Study (TIS) to identify trips generated by the project and the potential traffic impacts on the surrounding streets and highways.

We recommend using the Caltrans *Guide for the Preparation of Traffic Impact Studies* (TIS Guide) for determining which scenarios and methodologies to use in the analysis. The TIS Guide is a starting point for collaboration between the lead agency and Caltrans in determining when a TIS is needed. The appropriate level of study is determined by the particulars of a project, the prevailing highway conditions, and the forecasted traffic. The TIS Guide is available at the following website address: <http://dot.ca.gov/hq/tpp/offices/ocp/igr_ceqa_files/tisguide.pdf>.

The TIS should include:

1. Vicinity map, regional location map, and a site plan clearly showing project access in relation to nearby State roadways. Ingress and egress for all project components should be clearly

identified. The State right-of-way (ROW) should be clearly identified. The maps should also include project driveways, local roads and intersections, parking, and transit facilities.

2. Project-related trip generation, distribution, and assignment. The assumptions and methodologies used to develop this information should be detailed in the study, and should be supported with appropriate documentation.
3. Average Daily Traffic, AM and PM peak hour volumes and levels of service (LOS) on all roadways where potentially significant impacts may occur, including crossroads and controlled intersections for existing, existing plus project, cumulative and cumulative plus project scenarios. Calculation of cumulative traffic volumes should consider all traffic-generating developments, both existing and future, that would affect study area roadways and intersections. The analysis should clearly identify the project's contribution to area traffic and any degradation to existing and cumulative LOS. Caltrans' LOS threshold, which is the transition between LOS C and D, and is explained in detail in the TIS Guide, should be applied to all State facilities.
4. Schematic illustration of traffic conditions including the project site and study area roadways, trip distribution percentages and volumes as well as intersection geometrics, i.e., lane configurations, for the scenarios described above.
5. The project site building potential as identified in the General Plan. The project's consistency with both the Circulation Element of the General Plan and the Congestion Management Agency's Congestion Management Plan should be evaluated.
6. Identification of mitigation for any roadway mainline section or intersection with insufficient capacity to maintain an acceptable LOS with the addition of project-related and/or cumulative traffic. As noted above, the project's fair share contribution, financing, scheduling, implementation responsibilities and lead agency monitoring should also be fully discussed for all proposed mitigation measures.
7. Secondary impacts on pedestrians and bicyclists resulting from any traffic impact mitigation measures should be analyzed. The analysis should describe any pedestrian and bicycle mitigation measures and safety countermeasures that would in turn be needed as a means of maintaining and improving access to transit facilities and reducing vehicle trips and traffic impacts on State highways.

Traffic Impact Fees

Please identify traffic impact fees to be used for project mitigation. Development plans should require traffic impact fees based on projected traffic and/or based on associated cost estimates for public transportation facilities necessitated by development. Scheduling and costs associated with planned improvements on Departmental ROW should be listed, in addition to identifying viable funding sources correlated to the pace of improvements for roadway improvements, if any.

Vehicle Trip Reduction

Caltrans encourages the City to locate any needed jobs and services near major mass transit centers, with streets configured to facilitate walking and biking as a means of promoting mass transit use and reducing regional vehicle miles traveled and attendant traffic impacts.

We encourage you to develop Travel Demand Management (TDM) policies to encourage usage of nearby public transit lines and reduce vehicle trips on the State Highway System. These policies could include lower parking ratios, car-sharing programs, bicycle parking and showers for employees, and providing transit passes to residents and employees, among others.

Lead Agency

As the lead agency, the City of Mountain View is responsible for all project mitigation, including any needed improvements to State highways. The project's fair share contribution, financing, scheduling, implementation responsibilities and lead agency monitoring should be fully discussed for all proposed mitigation measures.

This information should also be presented in the Mitigation Monitoring and Reporting Plan of the environmental document. Required roadway improvements should be completed prior to issuance of the Certificate of Occupancy. Since an encroachment permit is required for any work in the State right-of-way (ROW), and Caltrans will not issue a permit until our concerns are adequately addressed, we strongly recommend that the County work with both the applicant and Caltrans to ensure that our concerns are resolved during the environmental process, and in any case prior to submittal of an encroachment permit application. Further comments will be provided during the encroachment permit process; see the sections below for more information regarding encroachment permits.

Mitigation Reporting Guidelines

The California Environmental Quality Act (CEQA) requires the adoption of reporting or monitoring programs when public agencies include environmental impact mitigation as a condition of project approval. Reporting or monitoring takes place after project approval to ensure implementation of the project in accordance with mitigation adopted during the CEQA

Ms. Margaret Netto, City of Mountain View
September 5, 2013
pg. 4

review process.

Some of the information requirements detailed in the attached Guidelines for Submitting Transportation Information from a Reporting Program include the following:

- Name, address, and telephone number of the CEQA lead agency contact responsible for mitigation reporting;
- Type of mitigation, specific location, and implementation schedule for each transportation impact mitigation measure; and,
- Certification section to be signed and dated by the lead agency certifying that the mitigation measures agreed upon and identified in the checklist have been implemented, and all other reporting requirements have been adhered to, in accordance with Public Resources Code Sections 21081.6 and 21081.7.

Further information is available on the following website:
<http://www.dot.ca.gov/hq/tpp/offices/ocp/igr_ceqa.html>.

Transportation Management Plan

If it is determined that traffic restrictions and detours are needed on or affecting State highways, a Transportation Management Plan (TMP) or construction TIS may be required of the developer for approval by Caltrans prior to construction. TMPs must be prepared in accordance with *California Manual on Uniform Traffic Control Devices*. Further information is available for download at the following web address:

<<http://www.dot.ca.gov/hq/traffops/signtech/mutcdsupp/pdf/camutcd2012/Part6.pdf>>.

Please ensure that such plans are also prepared in accordance with the transportation management plan requirements of the corresponding jurisdictions. For further TMP assistance, please contact the Office of Traffic Management Plans at (510) 286-4647.

Encroachment Permit

Please be advised that any work or traffic control that encroaches onto the State ROW requires an encroachment permit that is issued by Caltrans. To apply, a completed encroachment permit application, environmental documentation, and five (5) sets of plans clearly indicating State ROW must be submitted to the following address: David Salladay, District Office Chief, Office of Permits, California Department of Transportation, District 4, P.O. Box 23660, Oakland, CA 94623-0660. Traffic-related mitigation measures should be incorporated into the construction plans prior to the encroachment permit process. See the website linked below for more information: <<http://www.dot.ca.gov/hq/traffops/developserv/permits>>.

Mountain View, CA 94039

Attention: Margaret Netto

Subject: San Antonio Center – Phase 2

Dear Ms. Netto:

Santa Clara Valley Transportation Authority (VTA) staff have reviewed the NOP for 392,855 square feet of office uses, 118,050 square feet of commercial uses, 167-room hotel, and a movie theater on 9.9 acres at the southeast corner of San Antonio Road and California Avenue. We have the following comments.

Land Use

VTA supports the proposed land use intensification and mix on this important site located near El Camino Real and served by VTA Local and Rapid bus service, the San Antonio Caltrain Station, and a planned Bus Rapid Transit (BRT) station. El Camino Real is designated as a Corridor in VTA's Community Design & Transportation (CDT) Program Cores, Corridors and Station Areas framework, which shows VTA and local jurisdiction priorities for supporting concentrated development in the County. The CDT Program was developed through an extensive community outreach strategy in partnership with VTA Member Agencies, and was endorsed by all 15 Santa Clara County cities and the county.

Transportation Impact Analysis (TIA) Report

VTA's Congestion Management Program (CMP) requires a Transportation Impact Analysis (TIA) for any project that is expected to generate 100 or more new peak-hour trips. Based on the information provided on the size of this project, a TIA may be required. The updated March 2009 version of the VTA CMP TIA Guidelines should be used when preparing the TIA for this development. This document includes updated procedures for the analysis of bicycle facilities, parking, site circulation and pedestrian access, as well as roadways, and may be downloaded from http://www.vta.org/cmp/pdf/tia_guidelines.pdf. For more information on the TIA Guidelines, please call Shanthi Chatradhi of the VTA Congestion Management Agency Division at 408-952-4224.

Trip Generation Assumptions

The assumptions about the project's trip generation and any trip reductions for the existing use should be clearly documented. The proposed project is described as the replacement of 59,655

square feet of existing commercial and retail buildings with 392,855 square feet of office, 82,690 square feet of commercial and retail, a 167-room hotel, a 35,360 square foot restaurant and a 1,710-seat cinema. VTA's *Transportation Impact Analysis Guidelines* state the following regarding change of land use: "A new tenant occupying a vacant development or building who is changing the original use (and, therefore, the site's trip generation characteristics) may need to conduct a new TIA. If the change of use requires a discretionary permit and the number of net new trips during a peak hour meets or exceeds 100, a TIA is required." (Chapter 2 .1 (7b) Vacant or Underutilized Development – Change of Land Use, p. 7). The *TIA Guidelines* also provide guidance on trip generation assumptions for vacant and underutilized development in Section 6.3 Methodology for Future Scenarios (page 23).

Trip Reductions

Based on the project location, the transportation analysis may include trip reductions for proximity to transit. The VTA *TIA Guidelines* allow reductions for developments located within 2,000-foot walking distance of a transit station. However, the *TIA Guidelines* state that "The TIA should identify any pedestrian barriers that affect access from the development to the transit facility" (page 35), and also state that "The assessment of site circulation and access must explicitly discuss the relationship between site design and any vehicle trip reductions that are applied to the project" (page 43).

Freeway Analysis

Based on the project's size and location, there may be impacts to one or more freeway segments. The DEIR and TIA should include analysis of all freeway segments that may be impacted. For guidance on analysis of freeway segments for CMP purposes, see Section 2.2.2 of the *TIA Guidelines*. If the freeway analysis of the new segments indicates impacts of additional trips exceeding 1% of capacity, VTA suggests early coordination with the appropriate agencies to identify potential mitigation measures and voluntary contribution opportunities based on the latest Valley Transportation Plan (VTP) projects in the project area.

Pedestrian and Bicycle Accommodations

VTA requests that the DEIR and TIA address Pedestrian and Bicycle Accommodations in the analysis of Transportation/ Circulation impacts of the project. This analysis should include a consideration of the adequacy of pedestrian and bicycle facilities both within and nearby the project site, including facilities that may be used to access nearby transit stops. The site plans included with the NOP appear to show substantial upgrades to public street frontages including widened sidewalks and planted buffers between pedestrians and automobile traffic, consistent with the example set by the first phase of the San Antonio Center redevelopment project. VTA hopes to see these improvements described clearly in the DEIR & TIA and included as specific, enforceable conditions of approval for the project.

Bicycle Parking

VTA supports bicycling as an important transportation mode and thus recommends inclusion of conveniently located bicycle parking for the project. Bicycle parking facilities can include bicycle lockers for long-term parking and bicycle racks for short-term parking. VTA's Bicycle Technical Guidelines provide guidance for estimating supply, siting and design for bicycle parking facilities. This document may be downloaded from http://www.vta.org/bike_information/bicycle_technical_guidelines.html.

Transportation Demand Management Program

In order to reduce the number of single occupant vehicle trips generated by the project, VTA recommends that the City require a comprehensive Transportation Demand Management (TDM) program that meets or exceeds the trip reduction targets established in the City's Greenhouse Gas Reduction Program, including a monitoring component, as a Condition of Approval for the project. Effective TDM programs that may be applicable to the project include:

- * Parking pricing and parking cash-out programs
- * Public-private partnerships or employer contributions to improved transit service to the area (for example, shuttles to Caltrain or VTA Light Rail)
- * Transit fare incentives such as VTA Eco Pass, Caltrain Go Pass, or pre-tax commuter benefits
- * Bicycle lockers and bicycle racks
- * Showers and clothes lockers for bicycle commuters
- * On-site or walk-accessible services (day-care, dry-cleaning, fitness, banking, convenience store)
- * Preferentially located carpool parking
- * Employee carpool matching services
- * Parking for car-sharing vehicles

Transportation Demand Management – Transit Incentives

VTA recommends that the City consider requiring the project applicant to provide VTA Eco Passes, Caltrain Go Passes, or similar discounted transit passes to employees on a continuing basis, as a Condition of Approval of the project. The VTA Eco Pass is a photo ID validated with an annual sticker to provide unlimited rides on VTA Bus and Light Rail seven days a week. VTA sells Eco Passes at a discount to employers, housing developments, and educational institutions. For more information about VTA's Eco Pass program, please contact Angela Sipp of VTA at (408) 321-7519.

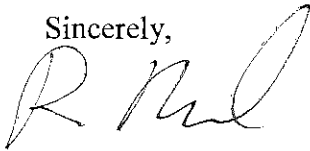

Bus Service

As mentioned in our comments on the Draft EIR for the earlier phase of this project, the bus stops along San Antonio Road adjacent to the project site should be improved to VTA standards.

Subject: Notice of Preparation of a Draft Environmental Impact Report for the Village at San Antonio Center – Phase 2 Project

Dear Ms. Netto:

Thank you for the opportunity to review and comment on the Notice of Preparation of a draft Environmental Impact Report for the Village at San Antonio Center – Phase 2 Project (the “Project”). The City of Palo Alto would appreciate consideration of the following comments in the preparation of the Environmental Impact Report.

A. Transportation

1. The City of Palo Alto requests that the City of Mountain View consider transportation impacts on the San Antonio Road corridor from Highway 101 to El Camino Real. This includes a number of roadways and intersections within the cities of Palo Alto and Mountain View, including the Hwy 101/San Antonio Road interchange, Charleston Road, Middlefield Road, San Antonio Avenue (frontage road), Nita Avenue, Briarwood Way, the Central Expressway/Alma Street interchange, California Street, Miller Avenue, and Fayette Drive. In addition, other roadways that have the potential for cut-through traffic due to increased congestion on these corridors should be analyzed. City of Mountain View staff should coordinate the review of this corridor with City of Palo Alto transportation staff, in that recent Palo Alto studies and projects within this area may inform the EIR analysis.
2. In addition to the analysis of San Antonio Road, the City of Palo Alto requests that the intersections at Del Medio Avenue (including California Street, Miller Avenue, Fayette Drive, and West El Camino Real) and intersections at Monroe Drive and El Camino Real and Arastradero Road and El Camino Real be analyzed for transportation impacts.

CityOfPaloAlto.org

3. The Draft EIR should fully consider all mitigations that increase mobility without relying on drive alone automobile trips. Mitigation should include better connections to transit stations in Palo Alto and Mountain View and improved facilities for pedestrians and bicyclists. The Draft EIR should specifically focus on improvements to three planned bicycle boulevards in Palo Alto near the Project site, including the planned boulevards at Wilkie Way/Miller Avenue/Del Medio Avenue, Mackay Drive/Nita Avenue, and Chareleston Road/Montrose Avenue. Information regarding these and other nearby bicycle boulevards can be found in the City of Palo Alto Bicycle + Pedestrian Master Plan, July 2012).
4. The Draft EIR should fully consider a robust Transportation Demand Management (TDM) program as mitigation for the project. A TDM program for this project could be successful in reducing trips, thereby reducing possible air quality and climate change impacts.
5. Integrated Transit Facility- the Draft EIR Project analysis, or a Project alternative, should consider the effects of an on-site transit facility for the Project. A transit facility that includes space for Valley Transportation Authority (VTA) buses, Stanford University Marguerite shuttles, and other public and/or private future shuttle service. In addition, public amenities such as shelters, benches, lighting, landscaping, paving, bicycle racks, and signage could increase transit use to the Project site, thereby reducing vehicle trips and reducing air quality and climate change impacts that may be identified in the Draft EIR.
6. Connections to San Antonio CalTrain station- The Draft EIR should consider the effects of enhanced connections on private and public property to the San Antonio CalTrain station. Well-established pedestrian and bicycle connections to transit can reduce vehicle trips, air quality impacts and climate change impacts that may be identified in the DEIR.

B. Aesthetics

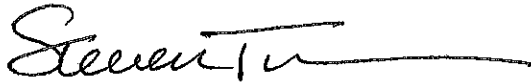

1. The Draft EIR should analyze the visual impacts of the buildings as viewed from the San Antonio Road corridor and residential neighborhoods in Palo Alto.

C. Construction Impacts

1. The Draft EIR should analyze construction impacts to Palo Alto, especially along the San Antonio Road and El Camino Real corridors.

The City of Palo Alto respectfully requests that the above listed comments be incorporated into the analysis for the preparation of the Draft EIR. If you have any questions or comments contained in this letter, please contact me at your earliest convenience: (650) 329-2155 or steven.turner@cityofpaloalto.org. I will serve as your point-of-contact for the City of Palo Alto.

Sincerely,

A handwritten signature in black ink, appearing to read "Steven Turner", with a long horizontal flourish extending to the right.

Subject: comments regarding proposed development at 405 San Antonio Rd.

Dear Ms. Netto,

as residents of the nearby The Crossings neighborhood, we would like to give some thoughts regarding the proposed development at 405 San Antonio Rd.

- the overall scale of the planned development is simply overwhelming.

The traffic situation around San Antonio as it is today is already bad. If the new development is put in place, the traffic will simply become unmanageable.

- if successful, the new development will also significantly increase pedestrian traffic from and to San Antonio CalTrain station through our complex (including early morning and late night hours). Therefore, we think that a dedicated pedestrian walkway (preferably not through The Crossings) from CalTrain station to the development is a must.

- as always, wide pedestrian walkways and sidewalks surrounded by large trees that give shade are important both from the aesthetic and the utilitarian standpoints. We think that the city should require any new developments to have these. Unfortunately, this has not been the case so far with the new Carmel Village developments.

- the architectural design of the Carmel Village leaves much to be desired, to put it mildly. We would like to see something more similar to The Crossings, for example, which, in our opinion, is a much nicer design.

Thank you for consideration,

Valentin Abramzon and Irina Trapido

Subject: Administrative zoning hearing - 405 San Antonio Road

To Whom it May Concern

I am writing to you today regarding the location of the proposed parking structure of the San Antonio Center (project location: 405 San Antonio Road). I strongly believe that in order for the San Antonio Center to be sustainable in the long-term it needs to be more pedestrian/bike friendly. I would like to make the following points regarding my motivation for this correspondence:

1. I would like to see that the area is made safer by segregating vehicle traffic from pedestrian/bike traffic through the implementation of a well planned circulation network policy that considers all user groups.
2. I would like to encourage the use of the public transit system.
3. I would like to see the adjacent neighborhood less affected by the development.

The San Antonio Center is the materialization of the vision for smart growth around public transit. Growth is a by-product of success, and Silicon valley and Mountain View are reaping benefits from the success of the tech industry. Unfortunately growth also presents certain issues in the form of 'growing pains' and 'teething problems'. However, I do believe it is possible to alleviate some of these headaches with careful design and planning. Currently, my biggest concern is the proposed 7-story parking garage on the corner of Pacchetti Way and California Street.

A 7-story parking facility would naturally attract vehicle traffic, and my concern is the impact this will have on pedestrians and cyclists, as well as the adjacent residential neighborhood. I feel that the location of this huge parking facility is going against the vision of the city of Mountain View – a vision of a more dense neighborhood that has a strong focus on the safety of pedestrians and cyclists.

The city of Mountain View currently has a circulation network map that promotes vehicle traffic on San Antonio and bicycles on California Street. I would add Pacchetti Way in the circulation network for pedestrian and bicycle traffic. The importance of this circulation plan is becoming more and more crucial as the density within the neighborhood increases. Currently, we expect the CalTrain to offer commuters an alternative mode of transport to cars. As the train station is situated very close to the proposed development, train commuters and cyclists will walk or cycle along Pacchetti Way to reach their offices situated within the San Antonio Center. Also, another office complex – the San Antonio Station (a 500 000 square feet office) – will bring even more people who would use the tunnel under the railway tracks to walk/cycle along Pacchetti Way. In addition, the Monta Loma residents will also walk/cycle along Pacchetti Way in order to reach the center.

Once these pedestrians and cyclists reach the intersection of Pacchetti Way and California Street, they will have to jostle moving traffic in order to access the complex, which poses a severe safety risk for these users. I also believe we will miss a huge opportunity to encourage more commuters to use the public transit system, as by placing a garage (and the inevitable heavy vehicle traffic that this will bring) between the train station and the office space, we will effectively discourage people from using the public transit system due to safety concerns, and a longer commute from public transit to their office.

The solution I propose is to move the parking structure further along San Antonio, and move the office complex (387 000 square feet) to the corner of Pacchetti Way and California Street.

I have attached a document called "making the most of Transit" from the Public Policy Institute of California, which was published in February 2011 (1). The first important conclusion that can be drawn from this study is that the relationship between the proximity of the office to public transport is typically reflected as an exponential curve. As the distance (and time) to commute increase, the ridership falls fast. The second conclusion is that siting of workplace/employment close to public transit is the best way to encourage public transit ridership. People who make non-commute trips to visit stores or attend events are much less likely to use public transit. An office on the corner of Pacchetti Way and California Street would make the walking commute around 5 to 10 minutes. This location is recommended, both in terms of safety and commute time, if we are wanting to encourage commuters to use public transit. Putting the parking garage between the transit and the office space would make it longer to commute for transit users, compromise safety of pedestrians/cyclists by mixing vehicle traffic with pedestrians/cyclists, and more importantly, it would encourage people to drive their vehicles rather than use public transit, walk or cycle.

Lastly, the office space is the best choice to integrate near the residential area, and will serve as an effective buffer between the residential and commercial areas. They complement each other because the residential area is more populated after work hours during the evening and weekend, while the office space will have its peak during work hours on weekdays. This will have much less of a negative impact on residents in terms of both traffic, noise and safety than a high-rise parking facility that by its very nature is designed to attract high volumes of vehicular traffic.

In conclusion, I believe this is an opportunity for the city of Mountain View to promote its vision of striving to be a more pedestrian/bike friendly city rather than only considering this as an afterthought. In the grander scheme of things, we should be encouraging people to walk, cycle and use public transport rather than private vehicles, in order to minimize our carbon footprint, reduce atmospheric pollution and greenhouse gas emissions, and ultimately in our effort to promote a more sustainably lifestyle and society. Last year, the Crossing neighborhood was visited by other cities as a great example of a transit-oriented development (ToD). It would be ironic to add a 7-story garage at the entrance of a transit-oriented development – a stark reminder to everyone that the car is still king.

Yours sincerely,

Charles Bransi

Making the Most of Transit

Density, Employment Growth, and Ridership around New Stations

February 2011

Jed Kolko

with research support from Marisol Cuellar Mejia, Davin Reed, and Eric Schiff

Supported with funding from The William and Flora Hewlett Foundation and the David A. Coulter Family Foundation

Summary

In 2008 California adopted Senate Bill (SB) 375, which requires the integration of land use and transportation planning to reduce greenhouse gas emissions from vehicle miles traveled (VMT). A prime example of such activities is transit-oriented development (TOD), the targeting of residential, commercial, or mixed-used development to areas around transit stations.

This paper assesses how well California has achieved the integration of land use and transportation planning by looking at employment growth around new transit stations from 1996 to 2006. Three facts, presented in the paper, underscore the importance of locating transit near jobs and encouraging job growth near transit:

- Transit ridership depends on proximity to transit, especially workplace proximity.
- Employment density is more strongly associated with transit ridership than residential density is.
- In California, residential density is higher than the national average and rising, but employment density is lower than the national average and falling.

Because employment patterns are at least as important for transit ridership as residential patterns are, and because employment patterns and commercial land use have received much less emphasis in policy work and the research literature, the analysis in this paper focuses on employment growth.

Looking across the 200-plus transit stations that opened in California from 1992 to 2006, we find that these new stations were located in areas with high residential density and very high employment density. Yet the opening of new stations was not accompanied by an increase in average employment growth in the areas immediately surrounding these stations (relative to comparison areas), either when the stations opened or several years afterward. What's more, employment around new stations varied widely: Employment growth increased near 18 new stations and decreased near 20, relative to comparison areas, with the largest increases in areas that had higher residential and employment density prior to the station opening. For the rest of the stations, the difference between employment growth around the station and in the comparison areas before and after the station opening was not statistically significant. Employment growth increased most around stations located in higher-density areas.

In short, we find an absence of any boost to employment growth associated with the opening of new transit stations, on average. This finding runs counter to a goal of transit-oriented development policy and suggests that California has missed an opportunity to get the maximum increase in transit ridership and reduction in VMT from its recent transit investments. Existing zoning patterns and fiscal incentives, though favoring commercial over residential development, have not resulted in employment growth around new transit stations. Furthermore, most TOD policies—including the TOD strategy in SB 375—discourage commercial development relative to residential development near transit. But if California is to make the most of its transit investments, land use and transportation planning must do more to boost employment growth around transit stations.

Introduction

California has, for years, sought to tie its transportation planning to land use policy in order to balance economic growth, mobility, air quality, habitat preservation, and other goals (Barbour and Teitz 2006). In 2008, California adopted Senate Bill (SB) 375, which furthers the integration of land use and transportation planning in order to reduce greenhouse gas (GHG) emissions. As SB 375 requires, the California Air Resources Board established targets in 2010 for each of the state's 18 metropolitan planning organizations (MPOs), which, in collaboration with cities and counties, are required to integrate land use planning into the regional transportation planning process.

The emission-reduction targets will partly be met through a variety of policies designed to reduce vehicle miles travelled (VMT), including land use, pricing, and investments in transit and other alternatives to driving alone. Other policies, such as fuel standards, are also being used to reduce GHG emissions from the transportation sector, and California is trying to reduce emissions from other sectors as well (Bedsworth, Hanak, and Kolko 2011). Transportation models and previous research support this approach, demonstrating that integrated strategies that include, for instance, transit investments coordinated with zoning changes and parking policies, result in greater VMT reduction than policies undertaken singly.

A prime example of integrating land use and transportation planning for the purpose of VMT reduction is transit-oriented development (TOD), which aims to create compact, dense, urban spaces around transit stations through residential, commercial, or mixed-used development, supported by appropriate urban design and policies. Because transit-oriented development has the potential to shift residents and workers closer to transit, TOD has the potential to reduce VMT by raising transit ridership. New transit investments can raise the share of residents and workers close to transit in two ways: (1) by locating transit in high-density areas, and (2) by encouraging greater density around new transit stations.

Locating transit in high-density areas depends, of course, on the existence of high-density areas in the first place. Only the larger metropolitan areas with high-density neighborhoods can support fixed-line transit such as subways, rail, or streetcars, because density provides the ridership needed to make such systems economically feasible. The existence of high-density areas that are good candidates for transit stations is the result of cumulative public policy and private sector decisions and topographic constraints. This paper will demonstrate that transit ridership at the metropolitan level is indeed higher where the average density of the metropolitan area is higher, and that employment density is more strongly associated with transit ridership than residential density is. Looking at California's recent history, this paper also shows that new transit stations have been located in areas of relatively high density, though not as high as the areas around older transit stations.

Increasing density around new transit stations depends on both public- and private-sector decisions that encourage or discourage development, including zoning, urban design, and investment decisions. Even if the land around a new transit station becomes more valuable because of its increased accessibility, higher values result in new development and higher density only if local policies facilitate, or at least allow, development. Patterns of development around new transit nodes affect the extent to which transit investments lead to greater transit ridership and therefore the reduction of VMT and the achievement of SB 375 goals.

In recent years, California has invested considerably in fixed-line transit, with over 200 new transit stations opening in the state between 1992 and 2006, in both existing and new systems. Much more transit investment is planned for the future. The contribution of these investments to VMT reduction will depend, in part, on

how well these investments are integrated with land use planning and with existing transportation infrastructure.

This paper assesses how well this integration has been achieved in California in the period from 1992 to 2006, answering the following two questions in depth:

1. To what extent were new transit nodes in California located in areas with high residential or employment density?
2. How much have residential and, especially, employment densities increased around new transit nodes?

We focus on fixed-line transit, such as subways and light rail, because it represents a large share of transit investment. Fixed-line transit is also perceived to have the greatest potential for integration with land use planning (Bedsworth, Hanak, and Stryjewski 2011). Our focus is metropolitan and commuter transit—not inter-regional transit like high-speed rail—consistent with SB 375’s emphasis on integrated planning at the regional level.

This paper proceeds as follows. First, we provide a brief overview of land use patterns and transit trends, highlighting the most relevant findings for our analysis of integrating land development with transit investments. Two important facts stand out in each area:

Land use trends. Employment density in California is lower than the national average and falling, even though residential density is higher in California than the national average and rising.

Transit trends. Transit ridership falls sharply as distances from transit stations increase. This trend is even more pronounced for distances from workplaces than for distances from residences.

Next, the paper reviews research on land use and transportation, which concludes that employment land use patterns have at least as strong a relationship with transportation behaviors as residential land use patterns do.

Together, these sections provide the context for the paper’s two main research questions: Where did new transit stations open, and did residential and employment growth accompany those new stations? Our findings to these questions, along with results reported from previous studies, point to challenges and opportunities for reducing VMT in California.

In Brief: Land Use Trends

This section describes land use patterns and recent trends in the U.S. and California. Land use patterns are the cumulative result of decisions made over many years by governments, businesses, and households. Because buildings and infrastructure can last for decades or centuries, land use patterns change slowly except in rapidly growing areas with new development. Existing land use patterns can support or constrain transportation policy options.

Describing land use: Density and centralization

Density and centralization are two important measures of land use patterns. Put very simply, density reflects how tightly packed together people (or housing or jobs) are within a given land area, and centralization reflects the clustering of people (or housing or jobs) near the center of a city or metropolitan area. Decentralized land use tends to have lower density: the density of both population and employment typically declines with increasing distance from downtown. “Sprawl” often refers to land use that is both low-density and decentralized (Glaeser and Kahn 2004). But decentralization does not always imply low-density: a metropolitan area could be both decentralized and high-density if, for instance, it includes large, dense centers of employment outside of traditional downtowns. Although density is just one of many measures of land use patterns, the research literature suggests it is highly relevant for transit ridership and often closely related to other measures of land use patterns.

Density and centralization have the advantage of being relatively easy to quantify using widely available data, which facilitates comparisons across geographic areas at many levels (Census tracts, counties, metropolitan areas) and over time. Other measures of land use patterns include whether land is developed in a continuous or “broken” fashion; whether there are few or many sub-centers of employment outside of downtown; and whether different land uses, like residential and commercial, tend to be mixed or separated.*

The discussion of land use and transportation in this paper mentions the “jobs-housing balance.” This is one important measure of the mixing or separation of different land uses.

* Galster et al. (2001) defines a variety of land use measures and demonstrates that many are uncorrelated with each other. Lang and LeFurgy (2003) and Redfean (2007) examine employment concentrations outside of traditional downtowns.

Trends in Decentralization

For many decades, American cities have become less dense and more decentralized. Nationwide, urban population densities peaked in 1950, fell sharply between 1950 and 1990, and remained relatively constant between 1990 and 2000. Population has steadily decentralized since 1890 as suburbs have grown and the differences in density between higher-density cities and lower-density suburbs have narrowed (Kim 2007). Although employment is more concentrated near downtowns than are housing and population, only 21 percent of employment in large metropolitan areas is within three miles of downtown.¹

¹ I use “downtown,” “city center,” and “Central Business District” interchangeably throughout this report.

Despite these general trends in density and decentralization, metropolitan areas vary widely. In California, employment is more concentrated near the central business district (CBD) in San Francisco-Oakland (21 percent of metro employment within three miles) and Sacramento (22 percent) than in Los Angeles (7 percent) or San Diego (12 percent).² And although nearly all metro areas experienced further decentralization of employment between 1992 and 2006, this movement of jobs away from downtowns was more pronounced in some metros, such as Los Angeles and San Francisco-Oakland, than others, such as San Jose and Sacramento.

Explanations for increasing decentralization and declining densities fall into two categories: “natural evolution theory” and “fiscal-social problems” (Mieszkowski and Mills 1993; Nechyba and Walsh 2004). Under “natural evolution theory,” households consider both the cost of commuting to downtown jobs, which rises with increasing distance from the city center, and the cost of housing, which falls with increasing distance from the city center. Decentralization can result from either improved transportation technology that lowers the cost of commuting (e.g. cars replacing horse-drawn carriages, or the building of better roads) or greater demand for housing. The “fiscal-social” explanation is that lower-density suburbs grow as people move out of cities with bad public schools, high crime, and worse public services.³ Although, as Mieszkowski and Mills (1993) point out, these two broad explanations are related and hard to disentangle, the evidence leans more in favor of the “natural evolution” explanation. Glaeser and Kahn (2004) show that decentralization occurred even in metropolitan areas with lower central-city poverty, and Baum-Snow (2007) shows that the development of the interstate highway system in the 1950s and 1960s, which made commuting long distances into downtown easier, contributed significantly to sprawl.

These explanations for decentralization describe household behavior and either ignore business location decisions (fiscal-social problems) or assume businesses remain at the city center (natural evolution theory). Yet jobs, too, have decentralized to lower-density areas. People follow jobs to reduce their commutes, and jobs follow people to attract customers and workers (Kolko 2009). Extensive research has examined the effects of these trends on transportation behaviors and on other economic and social outcomes such as employment prospects, business productivity, workers’ skills acquisition, obesity, and public health.

² The central business district of a metropolitan area can be defined in multiple ways. Both Kneebone (2009) and this paper rely on a list of CBD Census tracts from the 1982 Census of Retail and consider the CBD as the center of economic activity in a metropolitan area. Place names refer to metropolitan areas.

³ “Natural evolution theory” is rooted in the monocentric city model, presented in Brueckner (1987); the “fiscal-social problems” explanation is based on the Tiebout (1956) model of residential sorting into jurisdictions.

Research approach

This analysis uses data from several sources: population from the decennial Census, housing from the decennial Census and the United States Postal Service (USPS), transportation behaviors from the Census Transportation Planning Package (CTPP), and employment from the National Establishment Time-Series (NETS) database. We present findings at the state, metropolitan area, Census tract, or Census blockgroup level. Metropolitan areas consist of one or more counties, counties are divided into Census tracts, and Census tracts are divided into blockgroups and then blocks. Census tracts are defined to represent a neighborhood and have, on average, 4,000 inhabitants; the typical blockgroup has 1,500 inhabitants.

The decennial Census reports population and occupied housing unit counts and land area at the blockgroup (and block) level.* CTPP transportation data are based on the 2000 Census and report commuting mode (drive alone, carpool, subway, bus, etc.) by place of residence and place of work at the tract and blockgroup level.

The NETS database is a national longitudinal microdata panel of the businesses in the Dun & Bradstreet business register. The NETS provides employment levels, detailed industry, and exact street address for more than 200 million establishment-year observations. The NETS records used here cover 1992–2006. No publicly available dataset approaches the comprehensiveness and geographic detail of the NETS. By geocoding the NETS, we generate employment totals by year by Census tract and blockgroup.**

* The latest decennial Census data are from 2000, and the follow-on American Community Survey (ACS) data do not yet report population or other variables at detailed levels of geography like Census tracts or blocks. Instead, we use tract-level data from 2008 on occupied housing units from USPS, which reports the number of addresses, active and vacant, residential and commercial, to the U.S. Housing and Urban Development Department (HUD). To our knowledge, these USPS/HUD housing unit data are the only nationally available tract-level data that show residential patterns after 2000.

** Nationally, 94 percent of employment was in establishments that geocoded successfully, with higher shares in urban areas. We omitted un-geocoded establishments from the blockgroup totals. We imputed Census tract location for un-geocoded establishments by matching reported ZIP code to Census ZIP Code Tabulation Area (ZCTA) and then allocating that employment to tracts.

Residential and Employment Density Patterns

Despite popular conceptions that California—particularly Southern California—is the epitome of sprawl development, residential density in California is well above the national average. In Table 1 we report weighted density measures, which are unaffected by the inclusion of undeveloped land within a metropolitan or state boundary.

Population density in California in 2000 was 49 percent higher than the national average.⁴ California's population density increased from 1990 to 2000, even though national residential density was unchanged. Although tract-level data on population since 2000 are unavailable, housing unit density—also weighted—continued its slight upward trend from 2000 to 2008, both in absolute terms and relative to the national trend.

⁴ Because we report weighted density, this means that the typical person in California lives in a Census tract that is 49% more dense than the typical person in the U.S. overall.

Measuring density

Conventional density is measured as the number of people (or housing units or workers) per square kilometer (or other measure of area). But metropolitan areas and states often include undeveloped or sparsely developed land, so conventional density measures can understate the density of the settled areas where people actually live and work.

Weighted density helps to account for this. Weighted density measures the number of people (or housing units or workers) in the areas where people actually live or work and therefore better reflect the land use patterns experienced by a typical person or worker.

Weighted population density for a metropolitan area is the weighted average of Census tract population density (tract population divided by tract land area) for all tracts in the metropolitan area, where the weight is the tract's share of metropolitan population. Tracts without population receive a weight of zero and therefore do not affect the weighted density of the metropolitan area (Glaeser and Kahn 2004). In effect, the weighted-density measure equals the tract density for the average person within a metropolitan area; we use the same method to calculate housing and employment density.

Because tracts with more population (or housing or employment) tend to have higher density, tract-weighted density measures for metropolitan areas tend to be higher than unweighted density measures. An alternative method for excluding undeveloped land is "net density": population (or employment) divided by land area excluding farmland, public lands, and other undeveloped areas (Galster et al. 2001). Net density requires detailed data on land uses in order to identify and exclude undeveloped land, whereas weighted density requires only on tract population (or employment) and land area.

To understand how weighted density measures work, consider two hypothetical cities, Sparseville and Densetown. Each has a population of 1,000 residents and consists of two one-square mile Census tracts. In Sparseville, 500 people live in each tract, whereas in Densetown, all 1,000 residents live in one tract and the other is undeveloped. Both Sparseville and Densetown have a conventional density of 500 people per square mile (1,000 residents divided by 2 square miles). But the weighted density measure is 500 people per square mile in Sparseville, since the average person lives in a tract with 500 people per square mile, while the weighted density measure in Densetown is 1,000 people per square mile, since the average person (in fact, all people) lives in a tract with 1,000 people per square mile.

Throughout this report, we report weighted density measures for metropolitan areas and states.

California's employment density is quite different than its population density. Employment density in California is lower than in the U.S. overall and—like the national trend—is falling.⁵ In 2006, employment density was 15 percent below the U.S. average. Employment densities have fallen most sharply near downtown areas: In the six largest California metropolitan areas, employment densities within three miles of

⁵ In general, employment density is higher than residential density: the employment density of the typical worker's Census tract is much higher than the residential density of the typical resident's Census tract, in part because people are more likely to work than live in areas like downtowns where both residential and employment density are high.

downtown fell nearly 25 percent between 1992 and 2006. Employment densities ten miles or more from downtown rose slightly over the same period.

TABLE 1
Residential and employment density in California and the U.S. (persons, housing units, or workers per square kilometer)

	California	U.S.	Ratio
Population density			
1990	3073	2171	1.42
2000	3230	2171	1.49
Occupied housing unit density			
1990	1154	924	1.25
2000	1179	890	1.32
2008	1197	887	1.35
Employment density			
1992	7351	8995	0.82
2000	7088	8575	0.83
2006	5632	6645	0.85

NOTE: Density is reported as residents, houses, or workers per square kilometer. Tract density weighted by tract population, housing, or employment as appropriate, as explained in text. Intuitively, this equals the tract-level density for the average person, housing unit, or employee in the metropolitan area.

In general, both residential and employment density are higher in larger metropolitan areas. Table 2 shows how California’s 12 largest metropolitan areas rank among the nation’s metropolitan areas according to population, residential density, and employment density. Although metropolitan area population is generally closely correlated with employment and, especially, residential density, these large California metro areas display considerable variation in density.

TABLE 2
National residential and employment density rankings for large California metropolitan areas, 2000

Metro	Population	Residential density	Employment density
Los Angeles-Long Beach-Santa Ana	2	2	23
San Francisco-Oakland-Fremont	12	3	3
Riverside-San Bernardino-Ontario	13	47	236
San Diego-Carlsbad-San Marcos	17	9	35
Sacramento-Arden-Arcade-Roseville	27	30	24
San Jose-Sunnyvale-Santa Clara	28	6	47
Fresno	58	40	144
Oxnard-Thousand Oaks-Ventura	61	19	212
Bakersfield	70	54	271
Stockton	82	21	209
Santa Rosa-Petaluma	98	89	206
Modesto	100	36	233

Note: Population data from Census; employment data from NETS. Each metropolitan area comprises one or more counties, following the 2008 Core Based Statistical Area definitions, as follows. Los Angeles-Long Beach-Santa Ana: Los Angeles and Orange Counties. San Francisco-Oakland-Fremont: San Francisco, Marin, San Mateo, Alameda, and Contra Costa Counties. Riverside-San Bernardino-Ontario: Riverside and San Bernardino Counties. San Diego-Carlsbad-San Marcos: San Diego County. Sacramento-Arden-Arcade-Roseville: Sacramento, El Dorado, Placer, and Yolo Counties. San Jose-Sunnyvale-Santa Clara: Santa Clara and San Benito Counties. Fresno: Fresno County. Oxnard-Thousand Oaks-Ventura: Ventura County. Bakersfield: Kern County. Stockton: San Joaquin County. Santa Rosa-Petaluma: Sonoma County. Modesto: Stanislaus County.

The Los Angeles metropolitan area ranks second in the nation in residential density, following New York. Yet it ranks only 22nd-highest in employment density. In fact, all but two metro areas—San Francisco and Sacramento—rank lower on employment density than on residential density, and many, including Riverside, Oxnard, and Bakersfield, rank much lower. San Francisco and Sacramento’s relatively high employment densities arise, in part, from the prevalence of industries that tend to cluster in traditional downtowns (like finance and government). San Francisco also saw rapid growth in a historical period when development patterns were denser.

The key fact for the analysis, below, is that employment density in California is below the U.S. average and falling. As we will show, lower employment densities are a challenge for supporting transit investments and for integrating land use and transportation planning.

In Brief: Transit and Driving Trends

Mass transit is a key part of California’s strategy to reduce traffic congestion, air pollution, and greenhouse gas emissions. Since the early 1980s, transit has accounted for well over a third of all transportation spending in California, with even higher shares in the major metropolitan areas. Most transit capital spending is associated with rail projects, including subways, commuter rail, light-rail, and streetcars (Bedsworth, Hanak, and Kolko 2011). This section reviews trends in transit ridership and its relationship to VMT reduction.

Transit Ridership and Proximity

For the state as a whole, the share of commuters taking transit increased from 5 percent to 5.5 percent between 1990 and 2008—76.4 percent of all commuters still drive alone to work. Nationally, the share of commuters taking transit looked much the same: 5.3 percent in 1990 and 5.2 percent in 2008.

The share of commuters taking transit to work varies by metropolitan area, with the highest transit ridership in higher-density metropolitan areas. The San Francisco area has the second-highest transit ridership in the country, 15.3 percent of commuters, though this is only half the level of New York (Table 3). The next-highest transit use in California occurs in Los Angeles—6.6 percent of commuters, less than half San Francisco’s ridership. Other large California metropolitan areas are well below the Los Angeles level, with the Inland Empire (Riverside and San Bernardino counties) having a transit share of just 1.9 percent.

Just as transit ridership varies across metropolitan areas, ridership varies within metropolitan areas. Proximity is an important factor. Transit ridership diminishes rapidly as distances from transit stations increase: one-quarter mile is the limit that most people will walk for most trips (Untermann 1984). Cervero (2007) uses one-half mile as the distance within which residents’ transit ridership differs from residents elsewhere on average, though he finds that residents of developments built near transit are more likely to commute by transit even if their workplaces are one mile from transit. Most studies of transportation behaviors reviewed in Arrington and Cervero (2008) and Cervero, Ferrell, and Murphy (2002) use either one-quarter mile or one-half mile as the distance from a station that affects mode choice.

Data from California illustrate how strongly proximity to transit determines ridership—even more for workplace proximity than for residential proximity.⁶ Within one-half mile of a transit station, 6.7 percent of residents and 7.2 percent of workers commute by subway, streetcar, or railroad (Table 4). In contrast, beyond one-half mile of a transit station (but still in counties with stations), only 1.1 percent of residents and 0.5 percent of workers commute by subway, streetcar, or railroad. Ridership, therefore, falls quickly at greater distances from transit. Yet even among Californians who live or work *within* half a mile of a transit station, the majority drive alone to work—so proximity to transit hardly guarantees high ridership.

⁶ We measure the distance from Census blockgroups to the nearest transit station (or “node”) that was operational prior to 2000, including stations on fixed-line rail, subway, streetcar, and a handful of bus-rapid-transit (BRT) routes, but not standard bus lines. Later in this report we describe these transit stations and their selection in greater detail. Blockgroup-level commute mode data come from the 2000 CTPP.

TABLE 3
Transit ridership among 40 largest U.S. metros, 2008

Metropolitan Area (California metros in bold)	Share of Commuters Using Transit (%)
New York-Northern New Jersey-Long Island	31.6

Drive alone	54.6	75.9	76.5	62.0	76.6	77.2
Share of residents or workers	6	74	21	12	68	18

NOTE: 2000 CTPP commuting behavior, relative to nodes operational 1999 or earlier. Columns 1, 2, 4, 5 include only counties with transit nodes: Alameda, Contra Costa, Los Angeles, Orange, Riverside, Sacramento, San Bernardino, San Diego, San Francisco, San Joaquin, San Mateo, Santa Clara, and Ventura. Other modes—ferry, motorcycle, taxi, and “other”—account for 1 percent of commutes. Excludes people working at home (3.8 percent of all California workers). Respondents who used mixed modes (e.g., bus plus rail or some form of transit plus driving) are asked to choose the principal mode, based on the longest distance traveled.

In fact, fixed-line transit ridership falls considerably at distances beyond just one-quarter mile of a transit station. Looking only at the share of commuters using subway, streetcar, or railroad, the likelihood of using transit falls by approximately half when comparing residents or workers within one-quarter mile of a transit station and those between one-quarter and one-half mile of a transit station (Figure 1). As distance from a transit station increases, the likelihood of using transit fall dramatically for both residents and workers—but especially for workers. Transit ridership for workers within one-quarter mile of a station is slightly higher (10.5 percent versus 9.7 percent) than for residents within the same distance, but, for each interval beyond one-half mile of a station, transit ridership is at least twice as high for residents as for workers.

FIGURE 1
Transit ridership decreases as distance from transit stations increases

NOTE: Commute mode data from the 2000 CTPP. Distance measured as straight-line distance from the centroid of the blockgroup of residence or workplace to the nearest transit station operational as of 2000.

Even among those who live near transit stations, ridership varies: 45 percent of Pleasant Hill BART TOD's residents commuted via transit, compared to only 3 percent of the LA Metro Long Beach TOD's residents (Lund et al. 2004). Workers' transit ridership was sensitive to workplace distance from the transit station. But residents' transit ridership was not sensitive to residential distance from the transit station.⁷ Transit ridership also depended on transit quality, including travel time and frequency of feeder bus services, as well as the availability and cost of workplace parking (Lund et al. 2004). Much of the relationship between household proximity to transit and transit ridership is self-selection: people who want to commute by transit choose to live near transit. Relaxing zoning regulations or other barriers to mobility would facilitate this self-selection and raise transit ridership (Cervero 2007).

Does Transit Investment Reduce VMT?

Transit investment and even transit ridership do not necessarily lead to VMT reduction. Even though transit availability is associated with higher transit ridership for nearby residents and workers, the effect of transit investment on VMT depends on numerous factors, some of which become apparent only after looking across multiple metropolitan areas that have experienced different rates of growth in public transit infrastructure.

Although transit's share of commuting rose in California from 1990 to 2008, VMT per capita rose as well, by 3.5 percent (this was less than the national increase of 13.7 percent). Among California's large metropolitan areas, those where transit share increased saw no greater reduction (or slower growth) in VMT per capita.⁸ Three possible reasons help explain this.

First: Rail investments tend not to increase overall transit ridership in most cities; rather, most rail transit commuters are former bus commuters, not former drivers, and the main effect of rail investment may be giving transit users a faster transit option rather than reducing VMT and associated emissions (Baum-Snow and Kahn 2005). Changes in commuting patterns support this claim for the nation overall but not for California. In the country as a whole, from 1990 to 2008, the share of fixed-line transit commutes (rail, subway, and streetcar) rose by 0.21 percent while the share of other transit commutes (primarily bus) fell by 0.26 percent. In California, the fixed-line transit share rose by 0.57 percent while other transit share fell by just 0.07 percent. The increase in California's fixed-line transit share was almost entirely a net increase in overall transit ridership.

Second: The "fundamental law of highway congestion" posits that road expansions are met with proportional traffic increases. Research has found that public transit investments have no effect on aggregate VMT, while road investments raise VMT proportionally (Duranton and Turner 2009). This research suggests that road investments raise VMT mostly by encouraging additional household driving and inducing more commercial driving.⁹

Third: Transit investments typically aim to serve commutes, which occur at peak times on the most congested routes. But commuting accounts for only 27 percent of total VMT. Non-commute trips like those

⁷ All sites studied were "within reasonable walking distance" of a TOD. Since residents elsewhere in the cities studied were much less likely to commute by transit, distance to transit affects transit ridership outside walking distance from a TOD.

⁸ Data on commuting patterns in this section come from the 1990 Census and the 2008 American Community Survey. Data on VMT come from the Federal Highway Administration's Annual Highway Statistics.

⁹ An extensive research literature on "induced travel demand" dates back to Downs (1962).

to stores, schools, and family or social events are much less likely than commute trips to use transit.¹⁰ Thus, increased transit investment and commute ridership could displace, at best, only a fraction of total VMT.

Therefore, transit investments might not reduce overall VMT. But public transit investments may be desirable for other reasons, not least for expanding transportation options without raising VMT as much as road investments would.

¹⁰ Hu and Reuscher (2004), Tables 6 and 9.

How Land Use and Transportation Connect

The relationship between land use patterns and transportation is “the most heavily researched subject in urban planning” (Ewing and Cervero 2010). This section reviews the evidence on the effect of land use patterns on transportation behaviors, and conversely, the effect of transportation features (like transit stations) on land values and development.

The Effect of Land Use on Transportation

In their wide-ranging research review and meta-analysis, Ewing and Cervero (2010) conclude that land use patterns have a modest but often statistically significant effect on transportation behaviors. As they point out, many studies of this question fail to consider causality: an observed relationship between, for instance, density and VMT could be caused by people who prefer transit choosing to settle in higher-density neighborhoods, rather than neighborhood density actually changing the travel behavior of residents. However, studies attempting to assess causality by controlling for individuals’ attitudes or focusing on people moving to different neighborhoods (Handy, Cao, and Mokhtarian 2005) have generally confirmed that density actually does affect travel behavior (Ewing and Cervero 2010).

The extent of a relationship between land use and transportation behaviors varies by different components: trip length, trip frequency, and “mode choice” — whether people travel by car, transit, or other means. Of these components, trip length and mode choice are most affected by local land use patterns. Trip frequency is determined primarily by household socioeconomic characteristics (Ewing and Cervero 2001).

Among measures of land use patterns, two “destination accessibility” measures — “job accessibility by auto” and living closer to downtown — have the strongest relationship to VMT (Ewing and Cervero 2010). Put simply, people who live closer to jobs or other destinations drive less. The relationship between proximity to jobs and VMT is strongest when proximity is defined as the availability of jobs within four miles of home, and this “jobs-housing” balance is more strongly related to VMT than the proximity of retail and services (Cervero and Duncan 2006).¹¹ Design attributes of street networks, such as short blocks and many intersections, also reduce VMT by encouraging walking and transit ridership. Controlling for these various land use measures, residential density has a weak relationship with VMT, and the relationship between employment density and VMT is even weaker (Ewing and Cervero 2010).

However, some land use measures are correlated with density: for instance, densities are higher closer to downtown, where blocks tend to be shorter and destinations more accessible by transit. Furthermore, focusing on the independent effect of each land use measure, holding other measures constant, may understate the overall effect of the built environment on transportation. Policies designed to change one land use measure in fact change related measures as well, so the effect of land use on transportation behaviors may be, as Ewing and Cervero (2010) note, “quite large” even though the relationship between many individual land use measures and transportation behaviors is small.

¹¹ Measures of the jobs-housing balance for places in California are available from PPIC on request.

From a policy perspective, what is “quite large”? The Transportation Research Board (2009) concluded that doubling residential density would lead to a 5–12 percent reduction in VMT, and possibly up to a 25 percent reduction with complementary changes in transit availability, the jobs-housing balance, and other factors. The committee involved in this research effort disagreed on how large an increase in residential density would be feasible and reported two scenarios. In the first scenario, 25 percent of new residential development would be twice as dense as typical new development, and residents of new developments would reduce VMT by 12 percent; as a result, overall VMT reductions over the period 2000–2050 relative to the base case would be roughly 1.5 percent. In the second scenario, 75 percent of new residential developments would be that dense, and residents of these new developments would reduce VMT by 25 percent; as a result, overall VMT reductions would be roughly 10 percent (TRB 2009, Table 5-2).¹²

The research literature suggests that integrated policies—such as those including both land use and transportation components—have a greater effect on VMT than land use policies alone. The Transportation Research Board (2009) report also considered a scenario of higher density *plus* complementary changes like transit availability that would lead to twice as large a VMT reduction as the upper-bound estimate of higher density alone. Rodier’s (2009) review of studies modeling the effect of land use, transportation, and pricing policies on VMT echoes this conclusion. Among the studies she reviews, transit policies alone (like service improvements) resulted in a median VMT reduction of 0.9 percent over 20 years; land use policies alone (like increased density) resulted in a median VMT reduction of 1.1 percent. But combined land use/transit policy scenarios resulted in a median VMT reduction of 8.1 percent. The estimated effect of integrated policies was far greater than the sum of land use and transit policies on their own. Some of this larger-than-additive effect arises because the models used to estimate effects of integrated policy scenarios deliver larger VMT reductions than simpler models do, even for the same policy (Rodier 2009). Nonetheless, some of the synergy appears to be due to policy coordination, not just methodological differences in the models.¹³

¹² TRB (2009) considered only residential density, not commercial/employment density, noting that forecasting commercial densities involved greater uncertainty and that modeling the relationship between commercial density and VMT were “beyond the resources of the study” even though the committee “recognized the importance of commercial development” (p. 148).

¹³ A third policy category, focusing on pricing, had larger effects: Cordon, congestion, and parking pricing policies, taken singly, had larger VMT reductions than land use or transit policies taken singly, and VMT and fuel taxes had dramatically larger VMT reductions than all other policies. But the maximum reductions were associated with coordinated land use – transit – pricing policies.

Beyond transportation: How land use affects emissions

Land use patterns affect emissions in many ways apart from transportation. Residents of center cities produce fewer emissions than suburban residents not only because of different transportation behaviors but also because city residents are more likely to live in smaller housing units, which consume less electricity (Kahn 2010). And residential emissions, through transportation, home heating, and electricity, vary not only across neighborhoods but also across metropolitan areas (Glaeser and Kahn 2010).

In several temperate California cities, per-household carbon emissions are lowest in the nation. These emissions are highest in several southern and southwestern U.S. cities, where demand for air-conditioning is high: per-household emissions are nearly twice as high in Memphis as in San Jose. Such comparisons suggest that the distribution of population across metropolitan areas could have a marked effect on overall national emissions. Strategies that could encourage growth in lower-emissions areas include a national carbon tax or, at the local level, relaxing restrictions on development in lower-emissions areas.*

* Glaeser and Kahn (2010) find that land-use regulations are more restrictive in lower-emissions areas like Los Angeles, San Francisco, San Jose, and San Diego than elsewhere.

Employment Patterns Affect Transit Use More Than Residential Patterns Do

Research on land use patterns and their relationship with transportation has focused primarily on residential land use rather than on commercial land use.¹⁴ Residential density around transit nodes, residents' travel patterns, and residential land use receive more attention in the research and policy literature than employment density, workers' travel patterns, and commercial land use do. One reason for this disparity is that data on population and housing for small geographic areas, like Census tracts, are more widely available than analogous data on employment, making it easier to measure patterns and trends in residential land use. Also, the classic land-use model that underpins the urban economics and planning literatures—the monocentric city model—assumes all employment to be at the city center, and that people make residential decisions based on commuting distance from their downtown jobs, the cost of housing, and other factors. Numerous policy studies and recommendations have focused primarily or exclusively on residential density and residential growth near transit stations (Transportation Research Board 2009; Calthorpe Associates 2010; Metropolitan Transportation Commission 2010). They rarely focus on employment patterns or growth.

Recent work, however, has challenged the traditional emphasis on housing density and residential land-use patterns by arguing that the location of employment matters critically to transportation behaviors. Employment densities and workplace proximity to transit are at least as important as residential patterns for achieving transportation goals (Frank and Pivo 1994). Theoretically, workplace proximity to transit should matter *more* for transit ridership than residential proximity to transit because “unlike the home end of the

¹⁴ Throughout the paper, “commercial” land use or development refers to all forms of non-residential land use or development – including retail, office, and industrial.

trip, where there are many options for accessing transit, generally, walking is the only available option at the work end” (Barnes 2005). Accordingly, employment densities at trip destinations affect ridership more than residential densities at trip origins (Arrington and Cervero, 2008; Transportation Research Board 2009).¹⁵ Furthermore, achieving high commercial densities is often more feasible politically than achieving high residential densities (Barnes 2005). Yet these research conclusions have not yet been fully incorporated into policy: “Connecting destinations to create ridership may seem like an obvious conclusion, but plans and policies have not reflected this approach. Most TOD policy have [*sic*] focused on residential development, rather than promoting agglomeration of jobs and commercial space in regional centers served by transit” (Center for Transit-Oriented Development 2009, p. 28).

Our own analysis confirms this.¹⁶ Looking across all metropolitan areas in the United States, those with higher density have higher transit ridership, but the magnitude of the relationship between employment density and transit ridership is twice as large as that between residential density and transit ridership. Furthermore, metropolitan areas where employment is more centralized in downtowns have higher transit ridership, even after taking residential and employment density into account. At the neighborhood level, transit ridership is higher both among residents of a Census tract where tract residential density is higher and among workers in a Census tract where tract employment density is higher. And again, the relationship is slightly stronger for workers and employment density.¹⁷ Transit investments, particularly in fixed-line systems such as subways, railroads, and streetcars, involve large capital costs that make economic sense only if potential ridership is high: denser areas support more transit investment, offer greater transit access, and have higher transit ridership. California’s relatively low employment density—especially outside of the San Francisco-Oakland metropolitan area—is therefore a challenge for supporting transit investments and raising ridership.

The Effect of Transportation on Land Use

Just as land use patterns influence transportation behaviors, transit investments have the potential to influence land use outcomes, including land values and densities. Over small geographic areas, such as a neighborhood or the one-quarter or one-half-mile circle around a transit station discussed earlier, transit investments could raise nearby property values if the increased accessibility raises demand in the immediate area for residential or commercial space. Increased demand could, in turn, lead to higher residential or commercial densities, in the absence of constraints on development. Alternatively, land values could fall if transit and any associated development create problems such as congestion or noise. The relationship between transit and surrounding land values and densities depends both on how businesses and residents value proximity to transit and on public-sector decisions about zoning, land use, and other incentives for transit-oriented development. This section reviews recent research on land use outcomes around transit stations.

Most of this research looks at property values rather than density. Giuliano and Agarwal (2010) consider changes in density to be only a “second-best measure” as a proxy for land values because changes in land value will affect density only if zoning and other land use policies permit. In reviewing the literature on

¹⁵ Employment near transit in more residential areas has the additional advantage of encouraging “bi-directional ridership,” maximizing the usage of transit infrastructure rather than trains running empty in the non-commute direction (Center for Transit-Oriented Development, 2008).

¹⁶ See appendix for details.

¹⁷ The standardized beta from a tract-level regression of residents’ transit ridership on log residential density is .38, and the standardized beta from a tract-level regression of workers’ transit ridership on log employment density is .47. Both coefficients are statistically significant, and both regressions include metropolitan-area fixed-effects.

transit and property values, Cervero, Ferrell, and Murphy (2002) emphasize that “numerous” studies find a positive relationship with property values, while Giuliano and Agarwal (2010) conclude that “results are quite mixed,” in part due to different research methods.¹⁸

However, for assessing the contribution of transit access to outcomes like transit ridership and resulting VMT reduction, density is more relevant than land value. A new transit station that raises surrounding land values but leaves densities unchanged will have a smaller effect on overall transit ridership than a transit station near which land values rise less but densities increase. Higher densities mean more residents, workers, or both are in close proximity to transit, which—as shown in the previous section—raises ridership. At the same time, zoning could prevent people who would use transit from moving close to transit stations (Cervero 2007).

Fewer studies have looked at land use changes, such as density, around new transit stations. Cervero and Landis (1997) found minimal impact of new BART stations in the San Francisco Bay Area on office construction and employment. Most new development was near freeways, not BART, though employment did increase around stations in downtown San Francisco, downtown Oakland, and a few other stations.¹⁹ Reviewing numerous studies of land use patterns around transit stations, Giuliano and Agarwal (2010) conclude that “rail transit does not consistently lead to significant land use changes,” and the land use changes that do occur are facilitated by complementary land use policies like development incentives and “stringent” parking management policies.²⁰ Yet the relationship between transit investment and land use patterns is far from settled. The Transportation Research Board (2009) called for further study of metropolitan employment patterns, of the development of employment sub-centers, and of “before-and-after studies of policy interventions to promote more compact, mixed-use development” (p. 205).

¹⁸ Lin (2002), Redfearn (2009), Mathur and Ferrell (2009), and Debrezion et al. (2007) assess property value changes around transit stations using various methodologies.

¹⁹ Cervero and Landis (1997) measure employment at the ZIP code level using Census County Business Patterns, as well as employment aggregate data from the Census Transportation Planning Package. They measure office construction annually at the parcel level using property tax records. They find office construction greater around BART stations where the level of employment density is higher. However, they measure employment density in 1990, close to the end of the interval over which the dependent variable, office construction, is measured (1973–1993), which brings into question their conclusion that employment density helps to explain the variation in office construction rates.

²⁰ They provide detail reviews of studies in Portland, the San Francisco Bay Area (Cervero and Landis 1997), and Atlanta.

Transit and Development in California

Transit-oriented development is a prime example of the type of integrated land use and transportation planning that has the potential to reduce VMT as envisioned under SB 375. California already has experience with transit-oriented development and strategies for future development. Did California have success in raising densities near new transit stations to maximize transit ridership and VMT reductions prior to SB 375 implementation? This section evaluates growth around all new transit stations in California between 1992 and 2006.

Transit Expansion in California

Our analysis of employment and residential growth and density around new transit nodes relies on data from the NETS, the Census, and information we collected on all new transit stations in California that became operational between 1992 and 2006. We included transit stations on fixed-line rail, subway, streetcar, and bus-rapid-transit (BRT) routes (we did not include standard or limited-stop bus lines). Compared to buses, fixed-line modes tend to offer faster speeds, cover longer distances, and have greater ridership capacity, making them more attractive anchors for TOD. The permanence of fixed-line transit stations also adds to their lure for associated land-use development, though this permanence also means that fixed-line routes, unlike buses, cannot be easily rerouted in response to changing development patterns or demand.²¹

The transit stations that opened in California between 1992 and 2006 were part of numerous systems throughout the major metropolitan areas of the state. In all, 217 stations opened, including extensions to BART in the San Francisco Bay Area, the Sacramento light rail system, the San Jose light rail system, San Francisco MUNI, and LA Metro Rail, and new or largely new systems like the Altamont Commuter Express, Coaster San Diego, the Harbor Transitway, and Metrolink Southern California (Table 5).²² The only new stations excluded from this analysis were those that overlapped with pre-existing stations on other routes.²³ Dozens of additional stations have opened after 2006, are under construction, or are planned, such as SF MUNI's Third Street line, the LA Metro Rail Expo line to Culver City, a light rail line from Monterey to Castroville, and the South Bay Bus Rapid Transit line from downtown San Diego to the border.

²¹ Fixed-line routes have high capital costs and therefore represent a notable share of California's investment in transportation and presumably the vast majority of transit capital investments. Over the past three decades, transit investments have accounted for 20 to 30 percent of all transportation capital expenditures (Bedsworth, Hanak, and Kolko 2011).

²² Information on these stations, including exact address and opening date, was gathered from transit system websites and from the National Transportation Atlas Database compiled by the Bureau of Transportation Statistics.

²³ The main instance of this overlap was the Market Street portion of the San Francisco MUNI F-line streetcar, which runs directly above MUNI Metro lines and BART trains. The F-line portion along the San Francisco wharves, however, does not overlap older fixed-line transit routes and therefore was included.

TABLE 5
Fixed-line transit stations in California

System	Nodes open before 1992	New nodes, 1992–2006
Altamont Commuter Express	0	8
BART	33	10
Caltrain	31	1
Coaster San Diego	0	6
Harbor Transitway	0	7
LA Metro BRT	0	13
LA Metro Rail	22	40
Metrolink Southern California	1	52
MUNI fixed lines	110	17
Sacramento Light Rail	31	18
San Diego Trolley	36	16
San Jose Light Rail	34	29
TOTAL*	298	217

NOTE: Total nodes before 1992 double-counts some stations on multiple systems, like Montgomery MUNI and Montgomery BART in downtown San Francisco. Total new nodes (1992–2006) does not double-count any nodes and does not include nodes overlapping with older nodes, like the F-Market above-ground streetcar Montgomery stop in San Francisco.

New transit stations opening between 1992 and 2006 were located in areas with higher residential density and much higher employment density than areas more than one-half-mile from a transit station (Table 6).²⁴ This strategy is consistent with the need to deliver high ridership in order to support transit investments. However, density around newer transit stations was lower than density around transit stations that opened before 1992: older transit stations—such as the central portions of BART and the LA Metro Rail—are located in big-city downtowns, the places in the state with the highest employment density. Older systems that have expanded since 1992—BART and LA Metro Rail, as well as Sacramento Light Rail, the San Diego Trolley, and San Jose Light Rail—have typically added new stations by extending lines outward rather than by adding stations in dense downtowns.

TABLE 6
Residential and employment density for blockgroups around older nodes, newer nodes, and rest of state

	Residential density, 1990	Employment density, 1992
Within ½ mile of pre-1992 nodes	6864	32392
Within ½ mile of nodes opening 1992–2006 but not pre-1992 nodes	5627	11146
More than ½ mile from old or new nodes, in counties with transit nodes	3673	3969
Counties without transit nodes	1571	1368

NOTE: Density weighted by population or employment in the blockgroup.

New transit stations are also often located near a freeway. Many transit stations, in fact, are located in freeway medians, such as portions of the LA Metro Rail Green Line and many BART stations in the East Bay. Medians have the advantage of being an existing right-of-way, as opposed to land already occupied with

²⁴ Employment density is the main factor. Residential density does not positively affect the location of new transit stations holding other factors, including employment density, constant.

other uses, but stations in medians may pose a challenge for land-use development since the area immediately adjacent to the station is the freeway, which makes pedestrian access more difficult (though proximity to a freeway could facilitate park-and-ride usage).

These patterns are consistent with maximizing the potential for transit ridership through transit investments. Transportation policy in California has successfully located transit stations in higher density areas, which should therefore lead to higher transit ridership and, in turn, greater VMT reduction for the metropolitan area or region.

Employment Growth Around New Transit Stations

In the context of SB 375 and integrated land use/transportation planning, steering growth toward new transit stations is expected to increase the share of residents, workers, or both near stations, thus raising overall transit ridership and lowering VMT. Encouraging growth around transit stations could also be an economic development strategy in itself to increase employment opportunities in a given area, but economic development is often at best a secondary goal of transportation planning, even when integrated with land-use planning (California Department of Transportation 2002 and 2010).

As noted earlier, our primary research focus is employment growth, rather than residential growth, property values, or other measures. And as demonstrated above, employment patterns are at least as important for transit ridership as residential patterns. The NETS provides data on employment on an annual basis at the street address level, which allows us to estimate employment counts within a precise distance of a transit station, just before and after the station opens. Information on residential trends is not available with comparable frequency or geographic specificity.

For assessing the potential contribution of transit investments to VMT reduction, changes in density are a better measure than changes in property values, even though changes in property values may be a better indicator of the economic development impact of transit investments (Giuliano and Agarwal 2010). Economic theory suggests that an increase in demand for land puts upward pressure on land values and induces development unless restricted by zoning or other constraints. Thus, increased density around a new transit station would mean that the demand for land around the station increased AND new development was permitted. An increase in land values WITHOUT an increase in density would still reflect an increase in demand for land around the transit station, but less potential for VMT reduction because the number of people or jobs near the transit station (and therefore likely to use transit) did not increase.

Assessing density rather than land value changes has another methodological implication. While the announcement of a new transit station might immediately raise the value of surrounding land through “capitalization,” density probably would not increase until the station is operational.²⁵ When a station is announced, developers might immediately bid up the price of the surrounding land in anticipation of the greater demand for tenants in their developments, but theoretically we should expect a business seeking to locate near the new transit station to be willing to pay the increased rent only once the station opens, making the location more accessible. Therefore, studies of property values around transit stations, should consider planned station announcements; in contrast, this research on density focuses on station opening dates.

²⁵ In their review, Giuliano and Agarwal (2010) note that some of the studies reporting higher land values around stations examined the period after stations were announced but before they were completed.

Analyzing employment changes around transit stations raises additional methodological issues. The first is choosing an appropriately sized area of land around the station. The research literature and the above findings on transit proximity and usage suggest a steep drop-off in usage starting one-quarter-mile beyond the station, which increases even more beyond one-half-mile. In our analysis, we focus on density changes in both the one-quarter-mile and the one-half-mile circle around the transit station.²⁶

The second methodological issue involves how to assess the relationship between employment density changes and transit station openings: Are these changes associated with the station opening or would they have happened anyway? We use the difference-in-differences approach, comparing employment growth before and after a station opens with employment growth in a comparison area that should be affected by the same economic trends and is as similar as possible to the transit station area except for actually having a transit station. The comparison area for each transit station is a set of twenty nearby (though not necessarily adjacent or contiguous) Census blockgroups, selected for their similarity to the transit station area on measures such as density and proximity to the central business district, to older transit stations, and to highways. Using regression analysis, we estimate the change in employment growth associated with the opening of a transit station, relative to the comparison areas, controlling for other factors. This method can be used to estimate employment growth associated with the opening of a particular transit station or the average employment growth associated with the full set of transit stations that opened after 1992 and before 2006.²⁷ Full technical details about this methodology and results are in the [Technical Appendix](#).

Averaging across all new transit stations, employment growth is one percentage point *lower* after a station opens than before it opened, relative to the comparison area. However, this difference from zero is not statistically significant, meaning that the true effect may be zero rather than negative. There is no evidence of faster employment growth one, two, or three or more years after the station opens than before it opened, either. Areas around new transit stations do exhibit faster employment growth than comparison areas *before the station opens*—so new transit stations tend to be located in areas where employment growth was *already* faster than comparison areas. Despite this, the opening of the new transit station was not associated with any boost in employment growth, which is what one would expect if the transit station opening raised demand for land and builders could respond with new development.

Although the average employment growth associated with a new transit station opening is not statistically significant, the employment growth associated with the opening of individual transit stations ranged from large, statistically significant increases to large, statistically significant declines. Of 204 stations that opened between 1992 and 2006, 18 exhibited statistically significant, positive employment change in the surrounding area relative to comparison areas; 20 exhibited statistically significant, negative employment change in the surrounding area relative to comparison areas. Figures 2 and 3 illustrate the employment growth associated with the opening of new transit stations in the Los Angeles and Sacramento areas, respectively, relative to comparison areas. Blue circles indicate faster employment growth in the station areas than in comparison areas, red circles indicate slower employment growth in the station areas, filled-in circles indicate statistical significance, and the size of the circle reflects the size of the growth differential. These figures show that transit stations whose openings were associated with faster employment growth were scattered across

²⁶ The analysis considers employment growth for a fixed area – one-quarter or one-half-mile – around the transit station. Density is employment divided by land area. Thus, when looking at the same land area over time, a change in employment is equivalent to a change in employment density.

²⁷ Because the NETS employment data covers 1992–2006, we only observe employment data after opening for stations opening in 1992 and only observe employment data before opening for stations opening in 2006. Our sample in the regression analysis includes the 204 transit stations that opened between 1993 and 2005.

regions and, within regions, across transit systems and routes. Some transit stations near each other exhibited similar patterns, but there are no consistent differences across regions, systems, or lines. Transit stations with statistically significant employment increases include the Hollywood/Highland and Hollywood/Vine stations on the LA Metro Rail, the Beach and Jones Streets stop near Fisherman’s Wharf on the MUNI F Wharves line in San Francisco, and the Sylmar/San Fernando station on the Metrolink Antelope Valley line in Los Angeles County (see text box).

Different paths to employment growth: Hollywood/Highland and Sylmar/San Fernando

Stations associated with large, statistically significant increases in employment growth include the Hollywood/Highland and Hollywood/Vine stations on the LA Metro Rail Red Line in Hollywood and the Sylmar/San Fernando station on the Metrolink Antelope Valley line in Los Angeles County’s northern San Fernando Valley. These stations were located in very different neighborhoods with very different TOD strategies.

The Hollywood/Highland underground subway station opened in 2000 and was a high-profile transit-oriented development project focused on retail and entertainment along Hollywood Boulevard. The Los Angeles Community Redevelopment Agency was integral in assembling land for development, negotiating financing with the city, and securing approvals for the \$600 million project that resulted in the Hollywood & Highland Retail Center, the Renaissance Hollywood Hotel, and the Kodak Theater (Cervero et al. 2004; California Department of Transportation, 2002). Both the Hollywood/Highland and the neighboring Hollywood/Vine stations were dense, developed, mixed-use areas even before their station openings.

The Sylmar Metrolink station in Santa Clarita opened in 1994. The nearby “Montage at Village Green” housing development opened in 2000. Whereas most TODs focusing on housing are “mixed-use developments” incorporating some commercial space, the Montage was exclusively a housing development (Moses et al., 2009). Data from the NETS database reveal that employment growth that accompanied the station development included small businesses across numerous industries, including grocery wholesaling, light manufacturing, construction, and real estate brokerage. Many of these businesses were located between the station and the housing development. The Sylmar example shows that employment can grow around new stations even when the station TOD strategy emphasizes residential development.

FIGURE 2
Employment growth associated with station openings, Los Angeles area

NOTES: Size of circle reflects magnitude of employment change associated with station opening. The four sizes reflect employment changes of with magnitudes of less than 1 percent, 1–5 percent, 5–10 percent, and more than 10 percent. Blue circles are positive, and red circles are negative. Shaded circles indicate statistically significant relationships between employment change and station opening. Stations in existence before the period of study are shown with black dots.

FIGURE 3
Employment growth associated with station openings, Sacramento area

NOTES: Size of circle reflects magnitude of employment change associated with station opening. The four sizes reflect employment changes of with magnitudes of less than 1 percent, 1–5 percent, 5–10 percent, and more than 10 percent. Blue circles are positive, and red circles are negative. Shaded circles indicate statistically significant relationships between employment change and station opening. Stations in existence before the period of study are shown with black dots.

A more systematic approach to explaining these variations in employment growth is to extend the regression model to include variables that might affect the relationship between transit and employment growth. The [Technical Appendix](#) describes these statistical “interactions” and presents the details. The main findings are that employment growth associated with transit station opening tends to be higher when transit stations are:

1. surrounded by higher residential density;
2. surrounded by higher employment density;²⁸
3. farther from an older transit station.

Other variables, like the distance from the transit station to the downtown or to the nearest highway and the stringency of local growth restrictions, did not affect the whether a new transit station was associated with faster employment growth.²⁹

Just as transit station openings were not, on average, associated with faster employment growth overall, station openings were not associated with consistent employment growth patterns in specific industries. The composition of employment near transit stations differs from the composition of employment in the economy overall. Near transit stations, sectors like wholesale trade, finance, professional services, and government are disproportionately represented; personal services, retail, education, construction, and other industries that tend to serve consumers rather than business tend not to locate near transit stations.³⁰ But the industries that tend to be located near transit stations did not exhibit faster employment growth *associated with new transit stations opening*.

Our main finding, that there was no increase in employment growth associated with transit stations opening, runs counter to a goal of transit-oriented development. We also find that TOD strategies have been unsuccessful, on average, in promoting residential development, which is generally the focus of these strategies: in fact, residential growth appears to have been significantly *slower* in the areas around new transit stations than in comparison areas. However, the residential growth data are less frequent and less current than the employment growth data, so the residential growth results do not reflect before-and-after changes in the same way that the employment growth results do. We therefore emphasize the employment growth results.³¹

²⁸ The relationship between employment growth and initial density was positive and statistically significant for only residential density, not employment density, for the one-quarter-mile circle around the transit station. In contrast, the relationship was positive and statistically significant for only employment density, not residential density, for the one-half-mile circle. For both the one-quarter- and one-half-mile circles around the transit station, the relationship between employment growth and employment density was approximately twice as large as the relationship between employment growth and residential density.

²⁹ Some of these factors did affect employment growth generally even if they did not affect the association between a transit station opening and *additional* employment growth. Employment in general grew faster in blockgroups closer to a freeway, closer to the CBD, and with less restrictive regulation, as well as in areas with lower residential density and lower employment density. See the “main effects” results from the interactive specification in the [Technical Appendix](#). Tracts identified as the CBD of metropolitan areas are available from PPIC on request.

³⁰ Transit stations tend to be closer to the CBD, closer to highways, and in areas with higher employment density and lower population density, all else equal. These factors help explain the location of many industries, and adjusting for these factors, many of the differences in employment composition around transit stations are no longer statistically significant.

³¹ The residential analysis is limited by the availability of Census population data, Census blockgroup population is available only for 1990 and 2000, whereas NETS employment data are available annually through 2006. The best one can do to assess residential growth is to compare population growth between 1990 and 2000 in areas where a transit station opened in that time period with population growth in comparison areas, controlling for the same variables as in the main analysis. Without annual population, one cannot compare population growth before and after the transit station opened using the same difference-in-differences framework. For example, if residential density declined between 1990 and 2000 around a station that opened in 1995, there is no way to tell whether that decline in residential occurred before or after the station opening in 1995.

Why Isn't Employment Growth Faster Around Transit Stations?

The lack of additional job growth around many new transit stations represents a missed opportunity for raising employment densities, increasing transit ridership, and lowering VMT. But it is consistent with how local officials focus their TOD efforts: Among localities with existing or planned projects to increase density around transit stations, projects were much more likely to emphasize residential than commercial uses. Regional transportation agencies appear to have been assuming that localities need more encouragement to build housing in the right places. In contrast, jobs—in the words of one transportation planner—are believed to “take care of themselves.”³²

These assumptions have probably taken root because land use policies in California have traditionally favored commercial (including industrial) development, both because these uses generate more local sales tax revenues and because it is generally believed that businesses require less expensive local public services than residents do (Boarnet and Crane 2001). Zoning practices reflect these assumptions: Land surrounding transit stations in Southern California in the mid-1990s was much more likely to be zoned for commercial/industrial use than for residential use, relative to other portions of the cities containing those transit stations (Boarnet and Crane 2001). More recently, a 2007 review of San Francisco Bay Area TOD policies reports that development goals for TODs include minimum density requirements for residential development but not for employment, in part because “cities already have considerable incentives to zone for non-residential uses, such as sales tax revenue and reduced fiscal impacts” (Nelson \ Nygaard 2007, pp. 5–7).

But our evidence shows that employment growth around transit stations does *not* take care of itself, even if zoning around transit stations favors non-residential uses. Existing zoning that allows commercial or industrial use may not, by itself, be sufficient to spur employment growth; often, more explicit strategies to encourage commercial development are necessary. A set of case studies of San Diego stations concluded that TODs were most successful when they coincided with local authorities' development plans for the area (Boarnet and Crane 2001). A study of the Washington DC Metro found that dense development around new suburban stations hinged on the “determination and foresight” of local officials (Schrag 2006). The major Hollywood/Highland TOD illustrates the importance of authorities in regional transportation and local development working together, well beyond the creation of a favorable zoning plan.

Researchers and TOD advocates have identified specific policies to encourage development and transit ridership around transit stations. Parking policies are often recommended. For instance, relaxing requirements for developers to provide a minimum number of parking spaces in residential TODs could encourage denser residential development (Arrington and Cervero 2008). Similarly, restricting the availability or raising the cost of parking could encourage transit ridership (Giuliano and Agarwal 2010; Shoup 2004). Such policies would be a shift from current practice. Very few communities charge for parking anywhere, and nearly all require employers to provide parking in new commercial developments. Some communities are relaxing parking requirements for residential developments, consistent with the general tendency to integrate transportation policies more with residential land use than with commercial land use (Bedsworth, Hanak, and Stryjewski 2011).

³² Quote taken from interview with California transportation planner for companion paper, Bedsworth, Hanak, and Stryjewski (2011). They also report that over half (56%) of the communities with these projects reported that they were all or mostly residential, about a third (31%) were evenly split between residential and commercial, and 13 percent were mostly commercial.

Other land use policies, such as waiving floor-area-ratio and height restrictions and providing development incentives, can also encourage TOD (Giuliano and Agarwal 2010; Center for Transit-Oriented Development, 2008). Building a mix of TOD businesses, including retail and personal services that employees use during the day, encourages transit use by making it easier to run errands near the workplace (Center for Transit-Oriented Development, 2008). Bolstering connectivity—including local bus feeder service to transit stations and walkable, bikeable streets nearby—helps increase transit ridership around TODs and, in making the location more accessible, is likely to raise demand for the location (Center for Transit-Oriented Development 2008).

Despite these recommendations for making TOD more effective, reviews of TOD implementation suggest that the barriers to carrying them out are formidable. Some barriers to developing higher densities around transit stations are similar those faced by high-density development anywhere—these include challenges in demonstrating financial feasibility, organizational issues with transit and other public agencies, and local resistance to multi-family housing and dense infill development. But high-density development around transit stations also faces unique barriers, including parking, increased local traffic congestion, different goals of transit and development agencies, and challenges financing and designing mixed-use development (Cervero et al. 2004).

Conclusion

California's ability to achieve VMT reductions through land use changes associated with transit investments is mixed. Residential density in California is above the U.S. average and rising. But employment density is below the U.S. average and falling—and employment density is more closely associated than residential density with transit ridership, meaning that California's job-related land use patterns are less conducive to economically feasible transit investments than land use patterns in other states.

With the exception of San Francisco and Sacramento, California's large and mid-size metropolitan areas have low employment density relative to their residential density. Among large metropolitan areas in California, Sacramento and the Inland Empire have the lowest transit ridership among commuters. The higher employment density of Sacramento suggests that transit has potential to gain ridership there, though the low employment density in the Inland Empire—combined with relatively low residential density—suggest that potential for fixed-line transit investment and ridership in the Inland Empire may be quite limited.

Strategies to encourage density in California must focus at least as much on employment density as on residential density. Our findings emphasize that employment density is more closely tied to transit ridership than residential density is. We also highlight the importance of proximity to transit stations: for ridership levels, proximity is even more important for workers than for residents.

California's recent transit investments have been in high-density areas, particularly in high employment-density areas: This is good. Furthermore, new transit stations have been located in areas that had faster employment growth before the opening of the station, relative to comparison areas (adjusting for factors like residential and employment density and distance to the downtown and highways). However, transit station openings were associated with no increase in employment growth; the faster employment growth in areas where transit stations later open would have happened even in the absence of the station opening.

Since coordinated land use/transportation plans have included transit-oriented development to tie growth to new transit investments, the lack of additional growth represents a missed opportunity for raising densities, increasing transit ridership, and lowering VMT. It does not appear that employment growth suffered from competition with residential growth: despite the traditional focus on housing in transit-oriented development, residential densities *fell* over the period when new transit stations opened, while employment densities held roughly constant.

Even though transit station openings were not associated with increases in employment growth on average, some individual transit stations were associated with faster employment growth after they opened. The variation in employment growth across transit stations follows some patterns: employment growth increased more around new transit stations with higher initial residential and employment density and around new transit stations farther from older transit stations. One possible explanation: areas with higher density have zoning in place—or lack local opposition—that supports further development. At the same time, these findings imply that employment growth around transit stations does not hinge on having lots of vacant land, since transit does not appear to boost employment growth significantly in relatively undeveloped areas.

We also found that stations in the same system, on the same line, or even next to each other sometimes exhibit quite different changes to employment growth. Conditions around the transit station, including local

zoning and other policies that could vary across stations, might therefore affect how much employment growth is associated with new transit stations.

It is surprising that, on average, employment growth around new transit stations was no faster than in comparison areas, which were selected because of their similarity in land uses, densities, and proximity to other transit stations and highways. It is especially surprising that even around lower-density primarily residential stations employment growth was, on average, no faster than it was in comparison areas, particularly because employment growth around stations in residential areas has additional benefits: increasing employment around stations that are largely suppliers of commuters toward downtown jobs can increase two-way utilization of costly rail capacity. Therefore, planners should aim to ensure that employment growth near stations, even those in residential areas, exceeds employment growth in nearby similar neighborhoods that lack transit access.

Researchers and practitioners point to parking, zoning, and urban design policies that could encourage development around new transit stations, as discussed above: these policies could provide encouragement to either residential or commercial development near transit. However, to encourage commercial development and employment growth specifically, existing zoning patterns and fiscal incentives—which traditionally favor commercial over residential development—have not been sufficient. Jobs do not, despite one planner’s claim, “take care of themselves.” Paradoxically, SB 375 could make employment growth around transit stations even more difficult to achieve because the law explicitly favors residential development in TODs: to receive exemptions from California Environmental Quality Act (CEQA) requirements, development projects near transit stations (called Transit Priority Projects) must be at least 50 percent residential, as measured by building square footage.³³ For California to reap the benefits that greater employment density around transit brings, the state should encourage commercial development relative to residential development near stations. Failing to take advantage of rail through more intense land development around stations is a significant missed opportunity to increase ridership and to make the most of costly transit investments.

Challenging as these TOD barriers are, questions about the ultimate impact of TOD on VMT reduction loom even larger. Even if land use policies and demand for space near transit were successful in raising densities near transit, the effect on regional VMT would likely be small. As noted above, three-quarters of workers within one-half mile of a transit station drive to work, most of them driving alone. Even within one-quarter-mile of a transit station—just a five-minute walk—only 10 percent of workers commute via fixed-line transit. Past transit investments in California have not gotten commuters out of their cars. Furthermore, commute trips account for only 27 percent of VMT, and trips for other purposes—school, social, personal business—are much less likely to occur on transit. Research examining transportation behaviors for metropolitan residents in aggregate, not just those near transit stations, concludes that transit investments have little impact on VMT, both because many new fixed-line transit commuters are former bus commuters, not former car commuters, and because transportation investments that initially might reduce congestion often induce additional driving.

And yet, integrating land use and transportation planning may contribute to GHG emissions reductions even in the absence of VMT reductions. If the planning encouraged by SB 375 succeeds in raising densities in California, emissions at the regional level could fall because higher-density residential units tend to be smaller and consume less energy. Furthermore, removing restrictions on residential or commercial

³³ SB 375’s primary incentive to encourage localities to integrate their land use plans with regional transportation plans is exempting designated development projects from the CEQA environmental regulatory review process.

development would lower land prices and encourage population, economic activity, or both, to shift from other places to California, where the mild climate requires less energy for heating and cooling buildings. Within California, removing restrictions on development in milder coastal regions could shift some growth away from the inland areas with a more extreme climate, where California's fastest population growth is expected (Kolko, 2010). Faster growth in California relative to other parts of the United States, or in milder regions of California relative to inland areas, may not reduce GHG emissions per capita in any one region, and therefore might not meet the goals of SB 375. But shifting growth to lower-emissions-producing areas could reduce per-capita emissions at the national or state level.³⁴ SB 375 may contribute to emissions reductions, however inadvertently, beyond those related to VMT reductions.

³⁴ And perhaps significantly. Glaeser and Kahn's (2010) estimates, reviewed above, show per-carbon household emissions as almost twice as high in some other parts of the United States than in some California regions.

About the Author

Jed Kolko is an associate director of research at the Public Policy Institute of California, responsible for managing the institute's economy research. He has conducted numerous studies of the California economy, economic development, housing, and technology policy. Prior to coming to PPIC in 2006, he was vice president and research director at Forrester Research, a technology consultancy, where he managed the company's consumer market research businesses and served as the lead researcher on consumer devices and access technologies. Jed has also worked at the Office of Federal Housing Enterprise Oversight, the World Bank, and the Progressive Policy Institute. He holds a Ph.D. in economics from Harvard University.

Acknowledgments

I am very grateful to Marlon Boarnet, Robert Cervero, Ellen Hanak, Matthew Kahn, Alison Nemirow, Michael Teitz, Egon Terplan, and Lynette Ubois for reviewing earlier versions of this paper; to Madelyn Glickfeld and Ned Levine for sharing their 1992 growth control survey data; and to Louise Bedsworth, Mike Duncan, Paul Lewis, Sujata Srivastava, Elizabeth Stryjewski, and Jeff Wood for suggestions, feedback, and additional data. I also benefited from comments from Elisa Barbour, Hans Johnson, Dean Mischynski, Eliot Rose, Maggie Witt, and many of the above reviewers on a companion report, *Driving Change: Reducing Vehicle Miles Traveled in California*, which incorporates many of the findings presented here. I alone am responsible for any errors in fact or interpretation

The Public Policy Institute of California is dedicated to informing and improving public policy in California through independent, objective, nonpartisan research on major economic, social, and political issues. The institute's goal is to raise public awareness and to give elected representatives and other decisionmakers a more informed basis for developing policies and programs.

The institute's research focuses on the underlying forces shaping California's future, cutting across a wide range of public policy concerns, including economic development, education, environment and resources, governance, population, public finance, and social and health policy.

PPIC is a private operating foundation. It does not take or support positions on any ballot measures or on any local, state, or federal legislation, nor does it endorse, support, or oppose any political parties or candidates for public office. PPIC was established in 1994 with an endowment from William R. Hewlett.

Mark Baldassare is President and Chief Executive Officer of PPIC.

Walter B. Hewlett is Chair of the Board of Directors.

Subject: FW: Scoping Comments for the Merlone-Grier San Antonio Center Project

From: Penny Ellson [<mailto:pellson@pacbell.net>]

Subject: Scoping Comments for the Merlone-Grier San Antonio Center Project

Dear Ms. Simas,

Here are my scoping comments for the San Antonio Center Merlone Grier project next phase.

Traffic concerns that the EIR should study:

- 1). Sight lines of the Phase I project at the San Antonio intersections for pedestrians and bicyclists are very bad due to location of building walls and signage obstructions. This should be studied and controlled with better specifications in the development of plans for the next phase.
- 2). Traffic from the incoming Google tenant at 100 Mayfield should be included in EIR analysis. The Mayfield site has been vacant for about a decade. In that time, background growth has filled the road capacity that was built for the site. **It would be very useful to understand the aggregate impacts of the San Antonio project and the Mayfield Mall site reoccupation if traffic data collection can be timed after Google occupies.**
- 3). Maintaining operational connections for all modes between the project and nearby cities is critical. Many of the users of the existing shopping center are in Palo Alto. No doubt, some of the future office workers will reside in Palo Alto as well. Areas to study impacts on or possible improvement to these connections are:
 - Bike/ped connections at Nita/San Antonio between Palo Alto and Mountain View. Help Palo Alto complete the connection that Palo Alto has started at the intersection of San Antonio/Nita. This provides access from Palo Alto to the 100 Mayfield site and the future connection to the train station and Merlone-Grier project. Palo Alto has already improved the San Antonio/Nita crossing on the north side of San Antonio Road. This connection would encourage bicycling to the future San Antonio Center and the 100 Mayfield offices from Palo Alto. It would also improve access to a Palo Alto cross-town bike route (residential streets connecting to off-road routes and the Bryant Street Bike Boulevard) for a complete bicycle connection from Mountain View all the way into downtown Palo Alto.
 - Bike/ped connections at from 100 Mayfield across Alma to train station underpass into the center
 - Bike bridge from Wilkie, improve connections across San Antonio to San Antonio Center, and across California Avenue into the future Center. This would provide another Palo Alto crosstown connection west of the train tracks via the Park Ave Bike Boulevard.
 - San Antonio Train Station schedule (Will there be increased stops? When? Current headways are too far apart to encourage robust use.) Analyze real transit benefits of existing bus and train service levels.
- 4). Maintaining operations on San Antonio to minimize auto traffic diversion to residential streets in Mountain View, Palo Alto, and Los Altos will be important. Please study San Antonio intersection operations--especially at Alma off-ramps, Middlefield, ECR, Charleston intersections as well as the 101 interchange.
- 5). Maintain operations of El Camino intersections for the same reason, including Charleston/Arastradero intersection.
- 6). Study impacts on beloved small, local retailers like the Milk Pail and historical sites. Consider what might be done to integrate them in the project and preserve them.

7). The Phase I EIR misreported the existing conditions on San Antonio Road in Los Altos and Palo Alto and Charleston/Arastradero in Palo Alto. Please check the number of lanes and correct this error in the Phase II EIR.

San Antonio drops to two lanes (with additional capacity at intersections) in Los Altos and Palo Alto...and there is no right-of-way to expand the street, so if Mountain View only plans for their small segment of San Antonio, access to 101 and 280 will be affected and traffic will back up in Mountain View due to these bottlenecks.

Charleston/Arastradero is mostly two lanes with turning lanes, NOT four lanes as described in the Phase I EIR.

Thank you for considering my comments.

Sincerely,

Penny Ellson

Ms. Melinda Denis
Community Development Department
City of Mountain View
P.O.Box 7540
Mountain View, CA 94039-7540

In re: Proposed development, 405 San Antonio Road, 050-12-PPA

Dear Melinda:

Following our review of Merlone Geier Partners' "Phase II" proposal plans dated May 20, 2013, and the preliminary discussion of these plans at the June 5, 2013 DRC meeting, we would like to submit initial comments on sustainable design issues that we hope to see resolved during the review process. We emphasize that these are informal preliminary comments. It would be very premature for us to work toward taking a position on the project at this point, and we have not attempted that.

1. Layout, open space, landscaping

Will there be a sufficient feeling of openness for those on the ground? That is, will people passing by, or strolling around the development, at least have sight lines to open space areas, and be able to get to them on foot easily?

At all points in the development, impervious surfaces should be minimized, and drought-tolerant trees and plants maximized, in relation to ongoing climate change. All plants should be water-wise as well as native species if possible.

Living roofs could be used to good advantage to moderate both the temperature and the aesthetics of such intense development. The proposed large areas of impervious surfaces (on roofs) also make them a logical candidate for this treatment, which helps meet the c.3 requirements of the Santa Clara Valley Urban Runoff Pollution Prevention Program.

2. Building design

All design decisions should be made in light of Council's question: "What makes this look like Mountain View?"

Details of the development should make a statement that it is human-centric, not car-centric: pleasant to be in on foot.

Architecture should be interesting and comfortable for those inside and out. Natural lighting, shading or other suitable treatment of windows exposed to major solar input, and other such sustainability-oriented details, are means to this end.

There should be considerable horizontal and vertical articulation, varied heights, and north-south view corridors through the project.

Design should be aesthetically and practically compatible with surrounding development (current and anticipated) to the extent possible considering the nature of this project.

For example, we ask for no additional non-functional very tall monument signs, which are not necessary or suitable in this locational context.

The proposed "community-serving retail" on California Street should have main entrances on that street and other pedestrian-friendly facade characteristics.

"Fronts" and "backs" of buildings should be distinct and in character: no loading docks or utility doors near main entrances or on main travelways.

All roads, sidewalks, etc., should be open to the sky except for canopies/overhangs that provide shade and shelter for people on sidewalks.

3. Circulation, mobility, traffic, transportation

We ask that the City make sure that development of modern street-design guidelines for this area, inside and around it, is a first priority in Precise Plan revision, as has been done for El Camino Real, allowing conformance of development proposals to upcoming standards from the start. These standards must include the all-important bike lane from El Camino Real to California Street on the east side of San Antonio Road.

All travelways within the site should be designed to be used safely by all traffic: motorized, bicycle, pedestrian, or other. Roads should be designed to discourage unsafe speeds. Modes should be separated where necessary, and any shared travelways designed to be safe for everyone. Both within the site and to/from contiguous areas, unimpaired access and safety for non-motorists should be emphasized. We are especially concerned that any internal pedestrian crosswalks should be obvious and easy to see, with high contrast between the crosswalk markings and surrounding pavement.

In relation to getting to and from the site, we think that this is a great location for high density with proper integration with transit and improved street design. Integrated planning for these features, and ways to make it easy for people to use them, could have positive impacts on transportation and mobility within the city. Without such planning, the proposed development looks like a transportation disaster in the making for that area. For example, the promise of "near Caltrain" should be implemented with clearly indicated and laid out routes for all "active transportation" modes to San Antonio Station and to buses at San Antonio Transit Center.

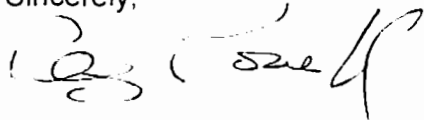

Especially in relation to office uses proposed, TDM conditions should also be put on the project, probably including participation in coordinated shuttle service to downtown and

North Bayshore. Such shuttle stops might well be site-internal, making them much more attractive to users and benefitting traffic conditions. This will require careful internal road design.

We are aware of the Environmental Planning Commission's comment that there should be no unmitigable impacts. That goal must be taken very seriously in all aspects of the project design.

Thank you for your dedicated work on the huge task of reviewing this project. We hope that our comments above will be useful.

Sincerely,

A handwritten signature in black ink, appearing to read "Peg Powell". The signature is fluid and cursive, with a large initial "P" and a long, sweeping underline.

Subject: Environmental Impact Analysis For 405 San Antonio Road, Application No. 050-12-PPA

Dear Mr. Gilli:

As you are aware, the Mountain View City Council and Environmental Planning Commission provided direction on several earlier projects that their environmental impact analysis / report ("EIR") include properties / projects in the affected area that are reasonably anticipated to develop even though no application is on file. This policy evolved to insure that the overall area development, stay within the existing infrastructure carrying capacity for water, sewer, gas, electricity, streets, traffic, etc., and that overall economic mitigations be developed in order to preclude a Council from having to make a finding of over-riding consideration and/or enforce exorbitant mitigations on the last to develop. Such policy is the corner stone of social equity and good urban planning as outlined in the City of Mountain View 2030 General Plan for the San Antonio Planning area.

In regards to the EIR for 405 San Antonio Road, Application No. 050-12-PPA, please include the surrounding properties and subsequent projects at a reasonable scope, density, and intensity as outlined in the City of Mountain View 2030 General Plan approved in July of 2012. Specifically, among other projects, please account for development of:

- Santa Clara Assessor Parcel Number ("APN") 148-29-023, approximately ~2.2 acres, hereinafter referred to as the Latham Street parcel that is directly across the street from Avalon Towers apartments and Boston Properties' office building as a 208 unit corporate housing / hotel development;
- APN 148-29-024 approximately ~2.1 acres, hereinafter referred to as 394 Ortega Avenue as a 112 unit senior assisted living facility that was previously approved as a 166 unit apartment complex as adopted by Mountain View City Council Resolution 8162, Series 1969, and Resolution 10101, Series 1974 (please note all fees [public works, recreation, etc.] have been paid to the City of Mountain View for the aforementioned development); and
- APN 148-29-022 approximately ~9.9 acres, hereinafter referred to as 555 Showers Drive as a 188,000 square foot retail center comprised of a 163,000 SF department store, 16,300 SF of retail shop space, a 3,300 SF quick service drive-thru restaurant, and a 5,400 SF automotive center.

Please note that the aforementioned projects utilize existing recreational amenities, e.g. the adjacent private recreational pool, kitchen, conference room and restrooms, and the neighborhood Klein Park directly across the street as detailed in the attached Initial Environmental Impact Assessment, R4-Zoning / Senior Assisted Housing Proposal, 394 Ortega Avenue, Mountain View, CA 94040. Most importantly, these developments enhance the overall quality of life while increasing the City of Mountain View General Fund through increased sales, transit occupancy, and property taxes and do not increase school enrollment as they are for seniors and young working professionals.

Your consideration of the overall impacts for the San Antonio Planning area is in keeping with City Council policy for neighborhood preservation, social equity, and sound urban planning design. Please acknowledge receipt of this email and its accompanying attachment. Thank you.

Sincerely,

MATT PEAR

I. INTRODUCTION

A. Project Title and Address:

Residential Community
394 Ortega Avenue
Mountain View, California 94040
Santa Clara County Assessor Parcel Number 148-29-024
Latitude: 37.400845
Longitude: -122.104958

B. Lead Agency Name and Address:

City of Mountain View
Community Development Department
500 Castro Street
Mountain View, California 94039

C. Contact Person and Phone Number:

Martin Alkire, AICP, Deputy Zoning Administrator
City of Mountain View
Community Development Department
(650) 903-6306

D. Project Sponsor's Names and Addresses:

Pear Enterprises
410 Ortega Avenue
Mountain View, California 94040
(650) 961-8521 x1

E. Current General Plan Designation and Zoning:

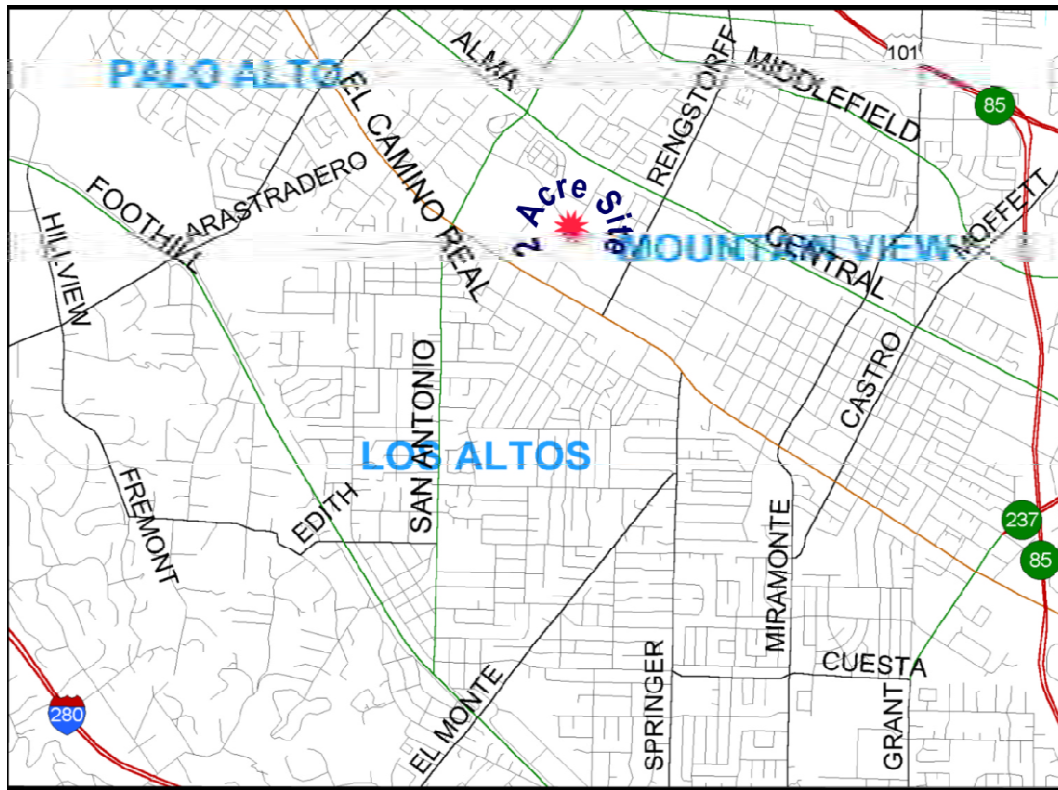

General Plan: Residential
Medium-Low Density (13-25 units/acre) On A Two Point One (2.1) Acre Site
394 Ortega Precise Plan
Zoning: R3-3

Proposed General Plan Designation and Zoning:

General Plan: Residential
High Density On The One Point Six (1.6) Acre Site (60 units/acre)
Eliminate 394 Ortega Precise Plan
Zoning: R4

F. Zoning History, Proposed Zoning, and Project Description:

The subject property is located at the southwest corner of California Street and Ortega Avenue, west of the major intersection of California Street and Rengstorff Avenue, east of California Street and Showers Drive and north of El Camino Real and Ortega Avenue (See Figure I.F.1). It is a remnant of Mountain View's agricultural past and is currently underdeveloped with one remaining single family residence, equipment garage, barn, Christmas tree sales office and shed, wood shed, and hard-packed gravel storage areas for farming and construction equipment

Location Map
Figure I.F.1

and materials. The 1,350 square foot homestead house was demolished in 2002 as a fire training exercise and the other structures such as the chicken coup, adjunct shed to the existing barn, and 1,500 square foot tank house collapsed due to the ravages of time. The existing buildings and storage areas are partially surrounded by ornamental and volunteer trees and shrubs, and volunteer weeds.

The 1968 City of Mountain View General Plan designated this property as one of two properties for high-density residential development at 75 dwelling units per acre with following explanatory comments:

“The area across Showers Drive from the San Antonio Complex should be developed as combination of commercial and high-density, high-rise residential structures. This would help to establish the character of the San Antonio regional complex as an urban place. This is one of the two locations within the Planning Area which is suited for very high density residential development.”¹

“The only other high-density residential D [1968 General Plan zoning designation for high-density residential development] is indicated in the area between Ortega Avenue and the new Baza’r store [which is now Target store]. This land is in large holdings and is not burdened with the problem of lot assemblage. The area is close to transportation, commerce and public facilities. It will provide a source of people for creating an active, well populated urban place of the San Antonio area.”²

¹ City of Mountain View General Plan 1968, p. 57, pp.3.

² Ibid., p. 71, pp.3.

On January 27, 1969, the Mountain View City Council adopted Resolution No. 8162, Series 1969, approving a Planned Community Permit for the development of a 166-unit apartment complex that spanned from Latham Street to California Street, fronting on Ortega Avenue. Due to tax liens, increased market interest rates, and lack of funds the project did not move forward and a search ensued for a joint venture partner.

Eventually 2.3 acres were sold due to the aforementioned monetary issues and a new format emerged consisting of three buildings that shared a common recreational facility comprised of 75 large condominiums and 45 apartments – the overall unit count was reduced from 166 to 120 by Resolution 10101, Series 1974 for unknown reasons (i.e., no reasons are cited in the minutes, staff report, or resolution). The first phase was completed and is known as Hastings Square West a two building 75-unit condominium development that includes an 11,550 square foot shared recreational area as well as the widening of Ortega Avenue and construction of street improvements (i.e., curb, gutter, water, sewer and storm water). The second phase was not constructed due to the inability to obtain financing because the number of apartment homes was insufficient according to lenders' standards at the time, i.e., a certain number of units are necessary for operation, financing, and construction economies of scale. The split in the number of units between condominiums and apartments allowed the Hastings Square West developer to obtain financing but precluded financing for the apartments.

The Site is well located for high density senior housing, more so than any other location in the City of Mountain View, for the following reasons:

- Senior housing environmental impacts are typically much less than multifamily due to the nature of the occupancy and size of the dwelling units in terms of massing.
- The Site exceeds the guidelines outlined in the City of Mountain View Environmental Sustainability Action Plan since it is already an urban village given its adjacency to retail, medical and transportation services, and on- and off-site recreational amenities; hence, there is no additional expenditures for these amenities or infrastructure.
- The Site is surrounded by high density multifamily developments, a park, and office/retail space. It is adjacent to Hastings Square West (which is the first phase of development for this property) a 3-story 75-unit condominium complex with partially submerged parking constructed in 1974, which is across Latham Street from the Domizile, a 4-story 132-unit complex with partially submerged parking and Avalon Towers, an 11-story (Latham Street side) 211-unit apartment complex, and Sobrato's 8-story office building housing the Silicon Valley Foundation, both of which have several levels of underground parking.
- It is directly across Ortega Street from Klein Mini Park and an east bound Valley Transportation Authority ("VTA") bus station.
- The Site has the vested right to use the adjacent 11,550 square foot shared recreational amenity consisting of a swimming pool and its associated exterior patio complete with benches and tables for hosting social events and a cabana complete with restrooms, kitchen, and meeting rooms.
- It is directly across California Street from Caltega, The Arbors, and The Californian (which are two and three story apartment complexes) and a west bound VTA bus station.
- It is directly behind and adjacent to Target Store (which includes general merchandise, pharmacy, groceries, and a Pizza Hut) and Wheel Works (a tire store that also performs minor automotive maintenance) and the San Antonio Regional Shopping Center, that includes Kohl's, Sav-On Drugs, Bank of America, Beverages & More, Fantastic Salon, Jo-Ann Fabrics & Crafts, Rite

Aid Pharmacy, Ross, Safeway, Sears, Trader Joe's, Wal*Mart, 24 Hour Nautilus Fitness Center, GNC and a host of smaller retailers and restaurants. Approximately 80 retail outlets occupy over one million square feet of building area spread across 80 acres in the immediate vicinity. The Center is an eclectic mix offering essential services and products in a price range to meet everyone's budget.

- The Property is adjacent to California Street, a major east-west arterial and a short distance between the major arterials of Central Expressway and El Camino Real that are connected by Showers Drive, Ortega Avenue, Rengstorff Avenue and California Street that allows traffic to quickly disperse after exiting the Property on either California Street or Latham Street and to calm down before entering the Site.
- This Site allows seniors an easy walk on lighted and signalized sidewalks to the San Antonio Regional Shopping Center, the Palo Alto Medical Clinic, Klein Park, which is right across the street, and Rengstorff Park and the Senior Center, which is two blocks to the east.
- Transportation is provided by the VTA along the major transportation arterials of California Street, El Camino Real (Hwy. 82), San Antonio Road, Showers Drive (which is also the VTA Regional Bus Transient Station) and Rengstorff Avenue. The Site is across the street from VTA bus stops and is less than 2,000 feet from the CalTrain San Antonio Train Station and 900 feet from the VTA Regional Bus Transient Station on Showers Drive.
- The Property's central location between residential communities and high-tech Silicon Valley companies affords progeny a sense of peace knowing their parents are in close proximity to all amenities and conveniently situated so that a visit is readily achievable during the work day on their way to or from work.
- Unlike other retirement communities which are self-contained over sprawling acres, this infill Site makes use of existing infrastructure and amenities to achieve an exceptional environment that others only attempt to replicate at great expense.

A zoning change from R3-3 to R4 is being requested in order to develop a senior residential development at 4-stories, consisting of at least eighty-five (85) dwelling units with below-grade on-site parking, leaving the 0.5 acre SFWD RW for other private recreational uses and not contingent on any other requirements for the development of the remaining 1.6 acres other than for meeting setbacks and open space requirements. The Site meets the City of Mountain View R4 Zone Development Standards Multifamily Housing Guidelines as stated in Section A36.12.030C and in terms of its contextual surroundings and zoning as shown in the General Plan Land Use Map (Figure I.G.2 on page 10).

This zoning request and Site meets the objectives of the Silicon Valley Leadership Group's housing objectives wherein a land recycling study states:

"Increased the height limit for high density developments located near rail stations. ... Cities should carefully review their general plans and zoning ordinances to find opportunities for increasing the number of homes that can be built per acre within existing residential neighborhoods, as well as for reuse sites that are appropriate for residential development. There are many ways to successfully blend new or different types of housing into existing neighborhoods without compromising the character or quality of life for residents. Cities have many powerful tools available to prevent any disruption new homes might create in these neighborhoods, such as...residential development standards and residential design guidelines [which the City of Mountain View has developed].

Steps cities can take to rethink allowable housing per acre include:

1. Review the existing general plan policies and land use categories to determine if they allow appropriate housing development opportunities and then make any necessary amendments consistent with the upcoming cycle of housing element updates.
2. If amendments are necessary, prepare an environmental impact document that reduces the need for subsequent environmental reviews on ordinary amendments and project approvals.
3. Review and revise the zoning ordinance and other development regulations to ensure that they are consistent with the amended general plan.
4. Look for opportunities to adopt specific plans for neighborhoods where new homes could be built, thereby ensuring that concerns are addressed on a community scale rather than a project scale.”³

Senior housing releases traditional housing for younger families. Two alternatives are envisioned for senior housing. The first being an independent senior living complex with few amenities to a senior assisted living complex consisting of a common dining area along with other amenities and administrative offices on the first floor with independent dwelling units on the second and third floors, and possibly an “early-stage” Alzheimer’s care ward on the fourth floor. Senior dwelling units are studios and one bedrooms measuring four hundred to six hundred square feet and are designed not only to provide independent living but also for seniors to interact and socialize so as not to remain in their homes all the time. The massing is much smaller than an apartment complex of the same unit count. In order to offer a full array of amenities and to achieve operational economies of scale the development needs to be comprised of a minimum of eight-five (85) senior assisted dwelling units in order to cover operating expenses for common area facilities, amenities, and social interactive programs.

Assisted Living offers help with non-medical aspects of daily activities in an atmosphere of separate, private living units. It can be likened to congregate living for residents less able to function independently in one or some of the aspects of daily living. In addition to providing meals, transportation for medical appointments, activities, and pleasure trips, assisted living may provide:

- Linens and personal laundry service.
- Assistance with dressing and bathing.
- Reminders regarding medication.
- Assistance with eating.

There is a lack of senior assisted housing that offers amenities and services in close proximity within the City of Mountain View and in the Mid-Peninsula regional market overall. Socioeconomic/demographic forecasts show the demand for senior housing increasing as more and more baby boomers retire. Senior housing can be independent living units in an apartment complex such as Ginton Terrace to the new Joshman Family Jewish Community Center that offers many services for seniors, families, and young adults. An internet search and yellow page listing under Assisted Living Facilities provides only six communities, most notably: Bridge Point by Kisco Senior Living, Classic Residence by Hyatt, Sunrise Assisted Living, and Belmont Villages.

³ *Building Sustainable Communities: Housing Solutions for Silicon Valley*, Silicon Valley Leadership Group, p. 14, pp. 1.

The closest senior living complex to the Property is Ginzton Terrace situated approximately 480 feet to the southeast, which was subsidized by the City of Mountain View and is a 107 unit (50+ dwelling units per acre) senior independent living (not assisted living) apartment complex that does not provide assisted living services. Mid-Peninsula Housing Coalition, a “non-profit” (only an IRS designation) developer operates a number of communities in the area that house seniors and they are all heavily subsidized by CDBG funding and other state and municipal funding sources. The leader in assisted living facilities is Sunrise Assisted Living wherein it actively operates four facilities in the Mid-Peninsula region and Classic Residence by Hyatt, which operates a luxury facility adjacent to Stanford Shopping Center, and the Forum, a former Marriott Senior Living Services (which was acquired by Sunrise Assisted Living) approximately 7 miles distant in the City of Cupertino. The major distinction in what is being proposed for this Site versus the aforementioned facilities is that not only are the aforementioned facilities essentially gated communities forming an island onto themselves, but they recreate the services and amenities that already exist within this Site’s immediate sphere of influence. Most retirement communities are not in locations where seniors can easily walk to amenities but are self-contained, which provide an established array of amenities at set prices whereas this Site provides more amenities and services in a price range to meet everyone’s budget as well as readily accessible to public facilities and infrastructure. Regardless of the number of existing senior assisted facilities, this Site is far superior due to its proximity to services, amenities, and offices wherein progeny can easily visit their parents, and the demographics indicate that demand will only increase for these facilities.

Other developers build communities around senior assisted housing that provide minimal amenities whereas this Site is surrounded by a full range of amenities including, but not limited to retail, recreational amenities, transit stops, and medical facilities all within easy walking distance on existing, lighted, signalized walkways. As the aerial photo on the next page (Figure I.F.2) illustrates: the Site is adjacent to the San Antonio Shopping Center sphere of influence; the Palo Alto Medical Foundation is less than a third of a mile to the south; the CalTrain San Antonio Train Station is approximately a quarter of a mile to the northeast; and the Site is surrounded by VTA Transit Stops and the Regional VTA Transit Hub. No significant unavoidable impacts have been identified in connection with the development and rezoning of this Site.

Figure I.F.2

G. Location of Site:

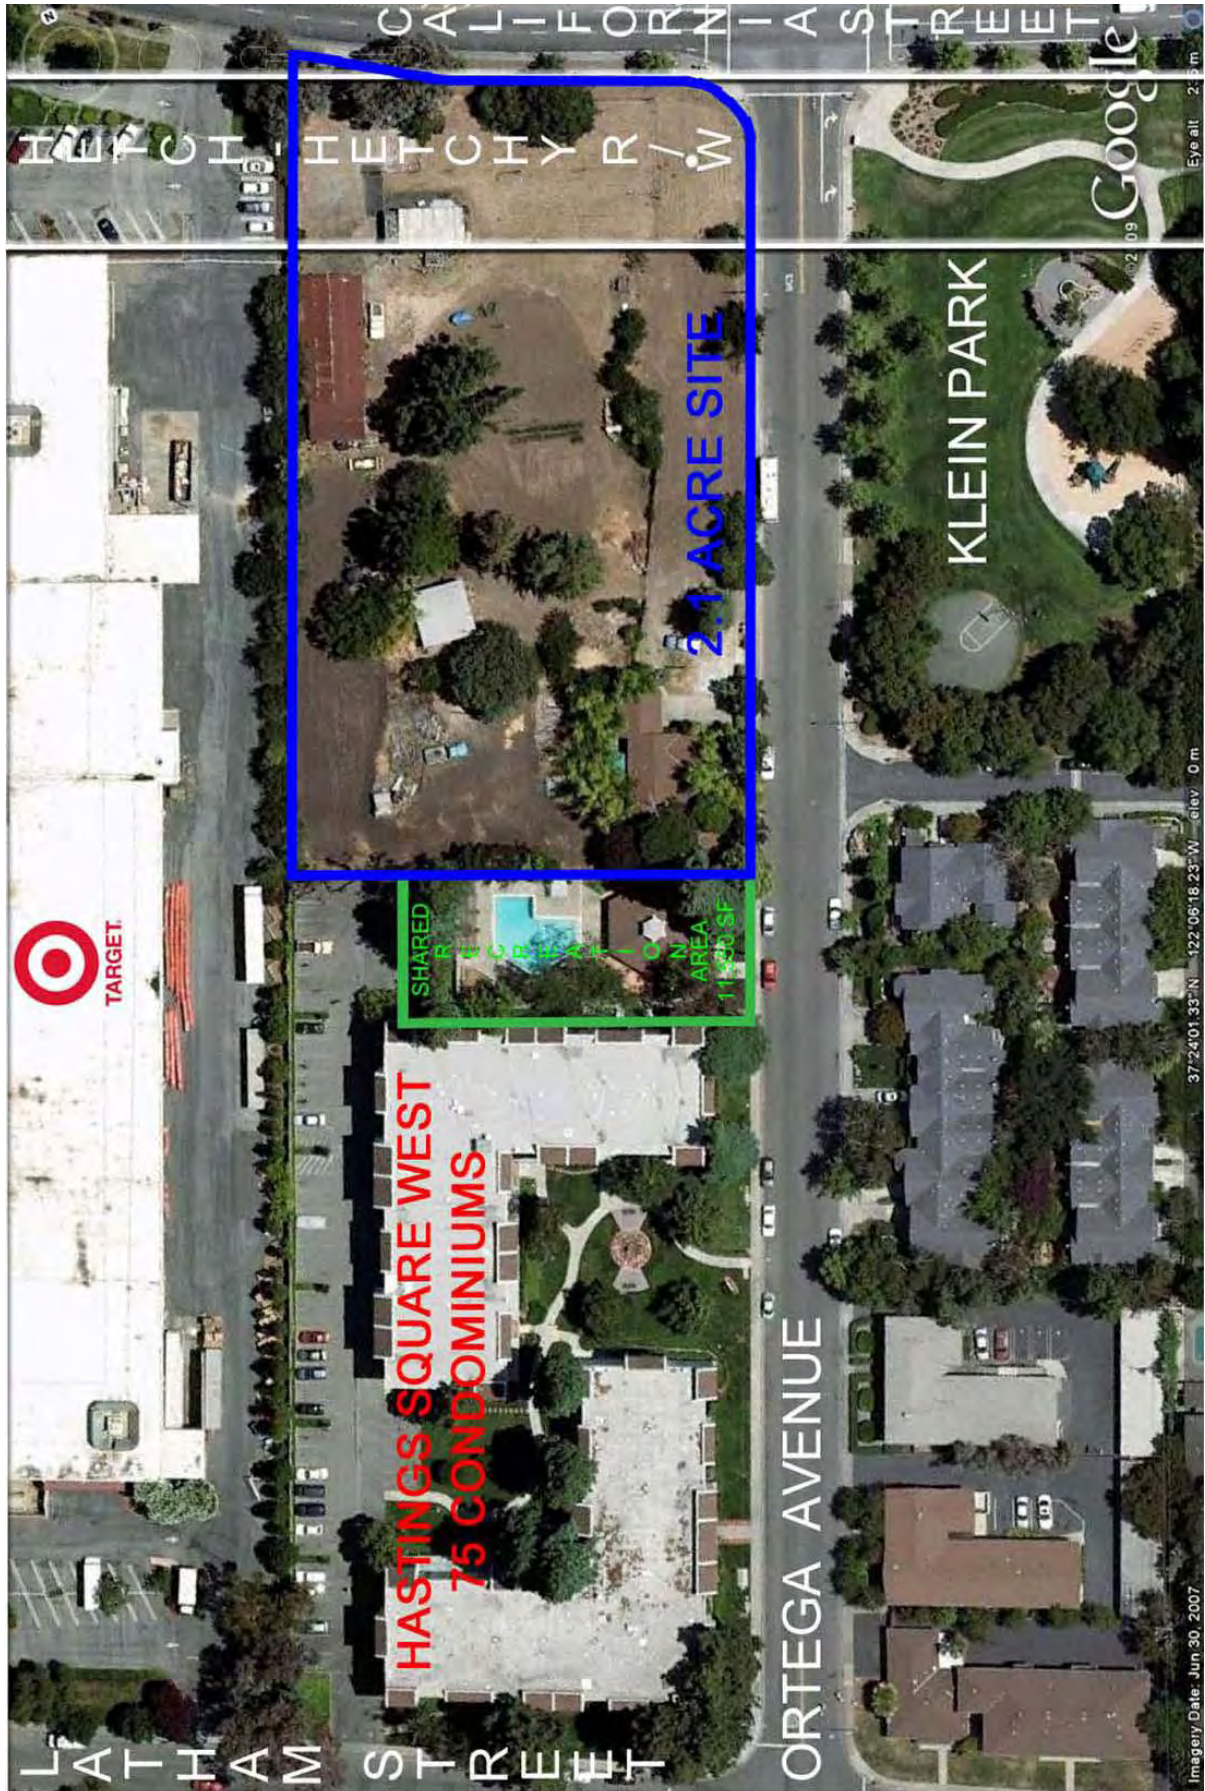

Figure I.G.1

As shown on the aerial photo on the previous page (Figure I.G.1) the applicant has fee simple title 1.615 acres and has surface rights to the remaining 0.5 acres for a total of 2.1 acres at the southwest corner of California Street and Ortega Avenue ("Site" or "Property") and has shared use of the adjacent 11,550 square foot recreational facility. The Site is approximately 404' feet along Ortega Avenue and 225' feet deep.

The fee simple interest spans both sides of the 0.5 acre San Francisco Water Department Hetch-Hetchy Right of Way ("SFWD R/W") and is noted in the Santa Clara County Assessor's Office as APN 148-29-024. The buildable area measures approximately 312 feet by 225 feet and an additional eleven feet (11') is located on the northern side of the SFWD R/W that is parallel to California Street and dwindles down to a point before Ortega Avenue.

Any residential development on this Site will have shared use of the adjacent 11,550 square foot recreational amenity that includes a swimming pool, patio seating, and a cabana with two gender specific restrooms, a conference area, and kitchen facilities. The use of these facilities is governed by the purchase agreement for the parcel that became the Hastings Square West condominiums. The agreement provided for a reduced purchased price in exchange for the Hastings Square West developer constructing not only the aforementioned recreational facilities but also the Ortega Avenue infrastructure (street widening, curb, gutter, gas, electricity, storm water, sewer, etc.) for the Site. The arrangement for the use of the recreational amenities is included in the Hastings Square West condominium grant deeds and by-laws. The Site is across Ortega Avenue from the 1.03 acre Klein Mini-Park; abuts Target Store's loading dock in back; has California Street, a major 4-lane, east-west arterial on one side; and on the remaining side Hastings Square West, a 3-story 75 unit condominium development over a partially submerged garage with a shared 11,500 square foot private recreation area.

The City of Mountain View General Plan Land Use Map on the following page (Figure I.G.2) shows the Site's surrounding zoning designations. The Site is surrounded by Medium-High Density R3-1 (26-35 units/acre) consisting of two to three story multifamily dwelling units that are predominately apartments. A number of the adjacent Hastings Square West condominiums and Oak Tree Commons townhomes are also rentals, i.e., not owner-occupied. Many of the two- and three-story multifamily developments are podium construction over partially submerged garages. Avalon Towers, the Sobrato office buildings, and the Domizile employ multi-level shared underground ventilated parking garages. In the case of Oak Tree Commons the General Plan Land Use Map incorrectly shows the southern portion (which is Ginzton Terrace, a senior housing development occupying the bottom third of the site) as Medium Density (13-25 units/acre) wherein it is actually developed at 50 units per acre, and the opposite is true for some of the surrounding apartments in that they were not developed to the full density as allowed under the R3-1.25 zoning designation mainly due to economics and site constraints (e.g., setbacks, parking, lot configuration, etc.).

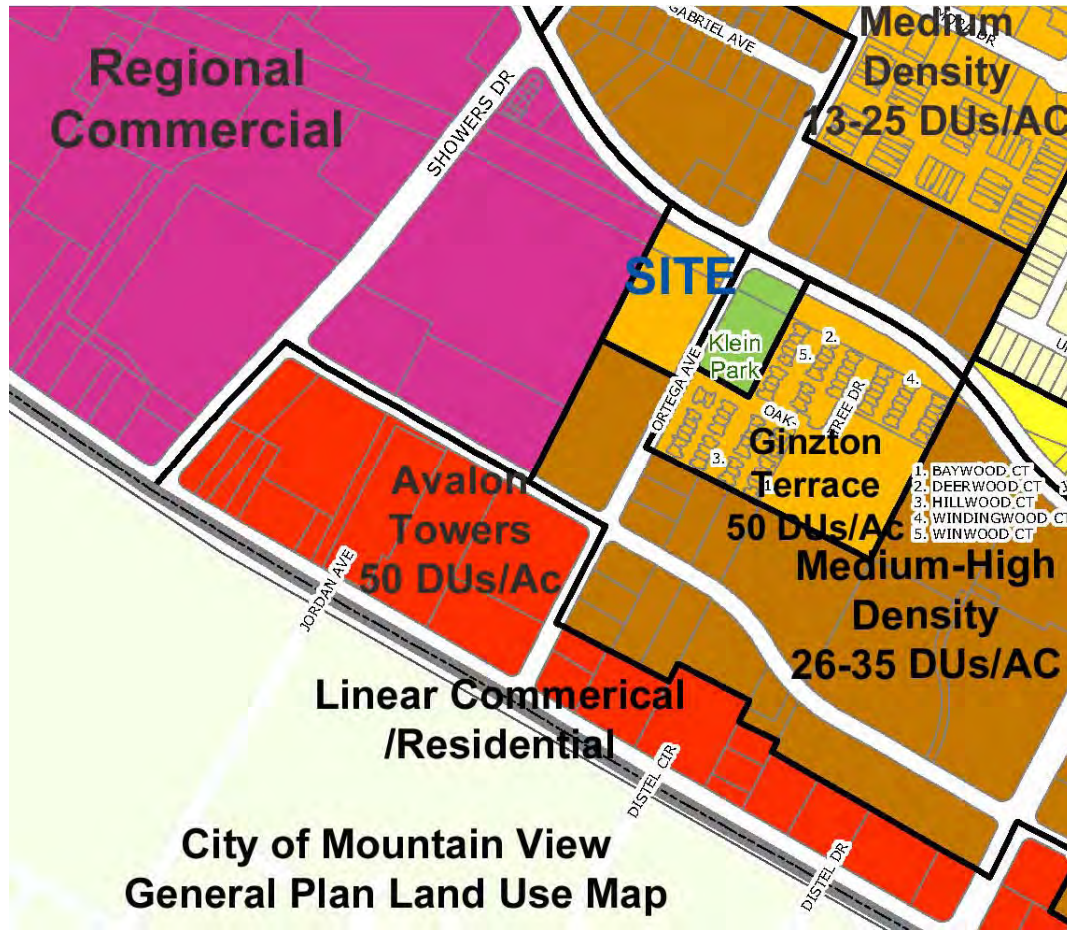

FIGURE I.G.2

The aerial photo on the following page (Figure I.G.3) provides the approximate height of various developments in the vicinity of the Property. The number of stories is marked on the aerial as a proxy for height and is denoted by the first number which indicates the number of stories and the second number that indicates the number of levels of underground parking. For example, a “2” indicates two stores, whereas “3+1” indicates three stories over a partially submerged garage and a “7+3” indicates seven stories over three levels of underground parking.

The photos that follow the aerial provide a ground level perspective at the location indicated on the aerial photo; e.g., “<1” provides the view from the Site into the adjacent three story Hastings Square West condominiums, whereas “<3” provides the view from the Site into the back loading area of Target Store. Of noteworthy interest is the view perspective of Avalon Towers a 10 story high-rise as viewed from El Camino Real versus an 11 story high-rise as viewed from Latham Street due to the difference in grade between El Camino Real and Latham Street; however, when viewed from locations “<2” and “<8” appears substantially lower than eleven stories due to the distance and viewing angle. As stated in the 1968 General Plan the Site “...is suited for very high density residential development” because it is midway between El Camino Real and Central Expressway (four lane, northeast-southwest arterials for the City of Mountain View) that allows traffic to calm down before reaching the Site.

a. None

ENVIRONMENTAL FACTORS POTENTIALLY AFFECTED:

Many of the subsequent environmental factors affect projects but the question is always to what degree and whether the effect can be mitigated to less than significant. The size and type of project determines the extent and significance for most impacts. In the subject case there are no "Potentially Significant Impacts" as indicated by the checklist on the pages that follows.

II. ENVIRONMENTAL CHECKLIST AND EVALUATION OF ENVIRONMENTAL IMPACTS

This section includes the Environmental Checklist required by the California Environmental Quality Act (CEQA), an explanation of responses made to questions on the checklist, mitigation measures necessary to reduce impacts to less than significant levels, and a finding as to the significance of each potentially adverse impact after mitigation.

This analysis is prepared by Sidney Consulting based on its subsequent analysis of the CEQA Environmental Checklist and the original Environmental Impact Report prepared for the subject property by Dr. Victor Riches of Riches Research, Inc., Mr. Nestor Barrett, former Santa Clara County Planning Director, Messrs. John Waters, David Powers, and Renato Martinez of Mission Engineers, Inc., and Mr. Karl Treffinger and Associates, Architects and Consultants on Design, dated May 1973.

- 1) A brief explanation is required for all answers except "No Impact" answers that are adequately supported by the information sources a lead agency cites in the parentheses following each question. A "No Impact" answer is adequately supported if the referenced information sources show that the impact simply does not apply to projects like the one involved (e.g., the project falls outside a fault rupture zone). A "No Impact" answer should be explained where it is based on project-specific factors as well as general standards (e.g., the project will not expose sensitive receptors to pollutants, based on a project-specific screening analysis).
- 2) All answers must take account of the whole action involved, including off-site as well as on-site, cumulative as well as project-level, indirect as well as direct, and construction as well as operational impacts.

- 3) Once the lead agency has determined that a particular physical impact may occur, then the checklist answers must indicate whether the impact is potentially significant, less than significant with mitigation, or less than significant. "Potentially Significant Impact" is appropriate if there is substantial evidence that an effect may be significant. If there are one or more "Potentially Significant Impact" entries when the determination is made, an EIR is required.
- 4) "Negative Declaration: Less Than Significant With Mitigation Incorporated" applies where the incorporation of mitigation measures has reduced an effect from "Potentially Significant Impact" to a "Less Than Significant Impact." The lead agency must describe the mitigation measures, and briefly explain how they reduce the effect to a less than significant level (mitigation measures from Section XVII, "Earlier Analyses," may be cross-referenced).
- 5) Earlier analyses may be used where pursuant to CEQA an effect has been adequately analyzed in an earlier EIR or negative declaration. Section 15063(c)(3)(D). In this case, a brief discussion should identify the following:
 - a) Earlier Analysis Used. Identify and state where they are available for review.
 - b) Impacts Adequately Addressed. Identify which effects from the above checklist were within the scope of and adequately analyzed in an earlier document pursuant to applicable legal standards, and state whether such effects were addressed by mitigation measures based on the earlier analysis.
 - c) Mitigation Measures. For effects that are "Less than Significant with Mitigation Measures Incorporated," describe the mitigation measures, which were incorporated or refined from the earlier document and the extent to which they address site-specific conditions for the project.
- 6) Lead agencies are encouraged to incorporate into the checklist references to information sources for potential impacts (e.g., general plans, zoning ordinances). Reference to a previously prepared or outside document should, where appropriate, include a reference to the page or pages where the statement is substantiated.
- 7) Supporting Information Sources: A source list should be attached, and other sources used or individuals contacted should be cited in the discussion.
- 8) This is only a suggested form, and lead agencies are free to use different formats; however, lead agencies should normally address the questions from this checklist that are relevant to a project's environmental effects in whatever format is selected.
- 9) The explanation of each issue should identify:
 - a) The significance criteria or threshold, if any, used to evaluate each question; and,
 - b) The mitigation measure identified, if any, to reduce the impact to less than significance.

A. LAND USE AND PLANNING

Will the proposed project result in the following environmental effects?	No Impact	Less Than Significant Impact	Less Than Significant With Mitigation	Potentially Significant Impact
1. Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Conflict with any applicable habitat conservation plan or natural community conservation plan?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Physically divide an established community?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. Affect agricultural resources or operations (e.g., soils or farmland)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

A.1: The Site is located on the southwest corner of the intersection of Ortega Avenue and California Street and is governed by the 394 Ortega Avenue Precise Plan (Resolution 14413, Series 1986: "Plan"), which states:

"The [S]ite can be developed with medium-density housing providing large-size units with the potential for owner-occupied family housing. Any development must fully incorporate the Hetch-Hetchy right-of-way. The Plan provides density bonus incentives for incorporation of the Hetch-Hetchy right-of-way."

The Plan is a zoning designation for townhomes/rowhouses and was not in keeping with the existing developments that surrounded the Site but nevertheless passed on a 4-to-3 vote for nonspecific reasons when the vacant Klein School site was rezoned for the Oak Tree Common townhomes; therefore, this R4 zoning request and residential proposal is in conflict with the current Plan but not with the original 1968 General Plan and prior approvals for high density multifamily dwelling units. The Plan is not in keeping with the surrounding zoning or development and the Klein School rezoning was in essence "spot zoning" and more than likely passed for the benefit of the Mountain View School District because "for sale" single family homes commanded a higher land value than apartments as most apartments ceased to be developed due to the 1986 Tax Reform Act. No explanation or environmental impacts are cited in the staff reports, minutes, environmental impact assessment, or Resolution for the change in product type that occurred under the Plan. For a full discussion of this matter please see the attached September 25, 2009, letter addressed to Mr. Michael Martello, City Attorney, and Mr. Randy Tsuda, Director of Community Development, City of Mountain View.

Upon further research, a Resolution and General Plan were discovered that further support the conclusion in the aforementioned letter. The property on the west side of Ortega Avenue from Latham Street to California Avenue was approved in 1969 for a 4-story 166-unit apartment complex (Resolution 8162, Series 1969). Due to the time it takes to process an application and arrange financing commitments in an ever changing financial and multifamily rental markets, the Pear Brothers lost their financing and were unable to proceed due to lack of funds and were forced to sell the southern portion of the property in order to pay taxes and to construct necessary street improvements (i.e., storm water, sewer, paved street and curbs and gutters, 6" sewer lateral, 3" water meter, and underground transformer vault) for the second phase of the project.

The second phase was a 45-unit apartment development on the Site (Resolution 9970 & 10101, Series 1974) and no environmental impacts are stated in the minutes or staff report for the change in density.

The Plan is incorrect and goes against the General Plan because the Site is:

- Adjacent to retail loading dock operations that inevitably are the source of early morning noise, especially when the space was occupied by grocery store wherein early morning deliveries were the norm;
- Located in a predominately rental community, except for the adjacent Hasting Square West condominiums;
- Affected by glare from the parking light standards employed in the adjacent retail parking lot and attached to the back wall of the building; and
- Affected by the adjoining retail site that is the source for complaints from the adjoining Hastings Square West Homeowners over the aforementioned issues even though the retail was fully developed and operational a full six plus years before the Hastings Square West condominiums were constructed (i.e., owners purchased with full knowledge of these impacts).

Given the aforementioned impacts prudent land planning would seek rental housing rather than mandate "for-sale" housing on this Site since it is incongruous with the existing retail operations and residential character. To impose "for-sale" housing on this Site is out of context with the neighborhood because homeowners demand land use change through political action whereas renters are free to move at any time. Homeowners on average move every seven to eight years whereas renters on average move every two years; therefore, rental housing is more appropriate for this environment.⁴

Furthermore, the Plan is in conflict with the Initial Study/Mitigated Negative Declaration for the R4 Multifamily Zoning Designation that identifies this Site as Candidate Area B for the R4 zoning designation.

The half acre SFWD R/W will be incorporated but not as a density bonus but as a use consistent with a residential development; i.e., meeting setbacks and open space requirements through landscaping, a private recreational area or garden, storage, or parking. Incorporating the SFWD R/W in any density formula for the development of the remaining 1.6 buildable acres or outside of the existing SFWD terms and conditions only leads to development, operational, and approval issues with the SFWD. SFWD's purchase of the right a way that bisects the Property for its aqueducts was based on the owner's continued use of the surface as allowed under the terms and conditions of the SFWD purchase agreement and grant deed and continued payment of insurance and taxes which the owners have faithfully performed for approximately sixty years from the inception of these agreements.

SIDNEY CONSULTING – ORTEGA EIA

Development of the project would attain several of the goals expressed in the City's General Plan including: Community Development (CD) Goal P, "to promote the opportunity to both live and work [and retire] in Mountain View" thus giving up housing suitable for families by moving into senior housing; Policy 42, "striving for a better balance of jobs and housing units;" and Residential Neighborhoods Goal B Policy 2, "to encourage housing on vacant in-fill land." In addition, because the site is adjacent to light rail and bus facilities, the project would implement (CD) Policy 44a, "to encourage development of the City's highest-density residential projects along major transit lines."

"The 1992 Mountain View General Plan includes goals, policies, and actions to ensure the preservation and enhancement of the City's character. Consistency of the R4 zone with the applicable General Plan goals, policies, and actions is addressed below. Policies marked (CD) are from the Community Development Chapter of the General Plan; policies marked (RN) are from the Residential Neighborhoods Chapter, which includes the City's Housing Element.

Policy 7: Encourage land uses that are compatible with character of character of the surrounding district or neighborhood. (CD)

Goal F: Maintain and enhance the quality and character of Mountain View's neighborhood. (RN)

The R4 *Multifamily Standards and Guidelines* provide the specifications for the application of the R4 zone and the design of new residential buildings built under the zone. As shown previously in Table 4, the R4 zoning designation could only be applied to sites that meet specific criteria. Primary criteria that must be met include that a site cannot be contiguous with R1 or **R2** zones. Therefore, a site zoned to R4 could not be adjacent to a site zoned for single-family homes or duplexes. R4 zones could be applied to sites within areas zoned and developed as R3 or R3D, Medium Density Residential. The R4 zoning standards, while permitting higher density, are largely the same character as R3 and **R3D** development. They are all zones that provide for multifamily residential building, while requiring substantial open space and landscaping. Further, the buildings types allowed in the R4 zones, stacked rowhouses, podium rowhouses, and stacked flats, are designed to provide multifamily units in buildings that look similar to existing rowhouses and apartment buildings in Mountain View. Therefore, the R4 zone is compatible with Policy 7 and Goal F of the General Plan.

Policy 1: Ensure that adequate residential land is available to accommodate the new construction needed to meet the Association of Bay Area Governments' (ABAG) Fair Share Housing Needs. (RN)

Policy 43: Investigate sites that have the potential to generate new housing, and amend the General Plan and zoning on these sites to residential uses where appropriate. (CD)

As indicated in the Project Description, the adoption of the R4 zone and subsequent development under the zone would result in the creation of 675 new housing units in existing residential areas in Mountain View over the next 20 years. As shown in Table 5, Total Housing Production for January 1999 through December 2005, ABAG has determined that Mountain View needs to supply a total of 3,423 housing units from 1999-2006 in order to accomplish their "fair share" requirements. Adoption of the R4 zone would allow for the development of 675 more units (19.7 percent) toward meeting ABAG fair share requirements and would place these units on land that is already being used for multifamily

residential development. Therefore, the R4 zone is compatible with Policy 1 of the Residential Neighborhoods chapter and Policy 43 of the Community Development chapter of the General Plan.

...

Goal A: Provide policies that encourage a range of housing including single-family, townhouses, apartments, condominiums, mobile homes, and other housing types. (RN)

Policy 2: Encourage a mix of housing types, including higher- density and lower-density housing. (RN)

The Legislative Action would allow for the rezoning of sites to higher density that would permit the development of new types of housing, including stacked rowhouses, podium rowhouses, and stacked flats, that are currently only allowed in Precise Plan areas. The R4 zoning designation is considered High Density, and future development under the R4 zone would increase the diversity of housing options in the City, making the Legislative Action consistent with Goal A and Policy 2.

Policy 3: Provide higher density housing near transit, near Downtown, and near other commercial areas. (RN)

Action 2.b: Determine appropriate densities for privately initiated zone changes based on the need for housing, surrounding uses, available infrastructure, and environmental constraints with the goal of increasing overall density of new construction. (RN)

The description of the R4 zone is given in the R4 Multifamily Standards and Guidelines as, "Multifamily housing that is close to transit, shopping and public facilities." Secondary criteria for permitting the rezoning of a site to R4 stipulate that a site should be within 2,000 feet of major transit nodes and within W mile of neighborhood serving retail.

Any development under the R4 zoning designation would occur as part of privately-initiated applications for rezoning. The Standards and Guidelines also provide guidelines that take into account available infrastructure and surrounding uses. Therefore, the Legislative Action is highly consistent with Policy 3 and Action 2.b.

Goal P: Promote the opportunity to both work and live in Mountain View. (CD)

Policy 42: Strive for a better balance of jobs and housing units in Mountain View. (CD)

At present, Mountain View provides more employment opportunities than housing, resulting in an imbalance in the ratio of jobs to housing units. Adoption of the R4 zone and the projected future development will provide new housing units that will help to reduce the imbalance and provide additional opportunities to both live and work in Mountain View. The Legislative Action is, therefore, consistent with Goal P and Policy 42 of the General Plan.⁵

In conclusion, the proposed R4 zoning designation is consistent with many of the goals, policies, and actions in the General Plan and 2010 Housing Element including the provision

⁵ Initial Study/Mitigated Negative Declaration (Environmental Impact Assessment) Adoption of R4 Multifamily Zoning Designation, § A. Land Use and Planning, p.10-11.
SIDNEY CONSULTING – ORTEGA EIA

for the City to provide its “fair share” of housing and the proposed project would not conflict with any plans or policies currently in effect except for the Plan.

A.2: Although the Site had its beginnings as a farm operated by the same owners as of today, there are no commercial agricultural resources or operations in the vicinity or on this Site. Soil is considered a resource in the context of landscaping, absorbing and retaining water, and providing a foundation for buildings. The proposed residential development would not affect these resources or require mitigation.

A.3: Land uses in the vicinity of the Site are primarily high-density residential dwelling units with a big box retail/commercial operation directly adjacent and behind the Site (see §I. Introduction (F) for a full description and neighborhood photos). The addition of proposed rental housing is highly compatible with these surrounding land uses. The proposed residential development will develop the last remaining vestige for this block and will be consistent with the surrounding land uses. It will not disrupt or divide the physical arrangement of an existing community but would continue the contextual surroundings.

A.4: The City of Mountain View is largely urbanized and the few remaining agricultural parcels are not commercial farms. For the past thirty plus years, this Site has not been used for agriculture production and there are no agricultural lands adjacent or in close proximity as shown in the City of Mountain View Zoning Map and aerial photos. Adoption of the R4 zoning designation for this Site will not affect any agricultural land, aside from the beneficial effect of providing additional housing units on non-agricultural lands, thereby potentially reducing development pressures on regional agricultural lands. No prime farmland, unique farmland, or farmland of statewide importance will be converted to non-agricultural uses, and no environmental changes will result that could cause the indirect conversion of farmland to non-agricultural use. Therefore, there would be no impact in this category.

Finding. No impacts to Land Use and Planning are expected and no mitigation is required as the proposed product type and zoning will enhance the City’s Goals and Policies.

B. POPULATION AND HOUSING

Will the proposed project result in the following environmental effects?	No Impact	Less Than Significant Impact	Less Than Significant With Mitigation	Potentially Significant Impact
1. Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

B.1: In Mountain View, the balance of jobs to employed residents is monitored by the City and the Association of Bay Area Governments (ABAG) for purposes of regional planning.

According to Projections 2009, the ratio of jobs to employed residents is 1.67 in 2010 and is projected to decrease to 1.60 in 2015. As stated in the General Plan, it is a goal for the City to “Strive for better balance of jobs and housing units in Mountain View.” The Housing Element of the General Plan also provides goals and strategies for addressing the regional jobs to housing imbalance, and over the past 10 years, the City has worked towards providing its “fair share” in meeting the regional housing need. Development of senior housing has a positive impact on the present imbalance between number of jobs and available housing units in the City by releasing traditional housing occupied by “empty nesters” that no longer require the space nor the expense of traditional housing. This in turn allows younger families with children to occupy these homes.

There is a scarcity of senior housing in the City of Mountain View and in the Mid-Peninsula regional market in general. The closest retirement community to the Site is Ginzton Terrace situated approximately 200 yards to the east of the Property which is a 107 unit (50 DUs/Acres) senior apartment complex that does not provide assisted living services. Sunrise Assisted Living is actively operating four facilities in the Mid-Peninsula regional market and both the Forum in the City of Cupertino and Classic Residence in the jurisdiction of the City of Menlo Park have sizable senior retirement developments that include assisted living facilities and Alzheimer care facilities but are essentially gated communities. Most retirement communities are not in locations where seniors can easily walk to amenities but are self-contained communities that provide an established array of amenities at set price points whereas this Site is surrounded by readily accessible amenities and a full range of services at various prices. Regardless of the number of existing senior assisted facilities the demographics indicate a growing demand for these facilities.

B.2 The proposed senior housing is expected to have single-and double-occupancy one-bedroom apartments and studios and that could add a minimum of approximately 85 residents (all single-occupancy units) to 128 residents (at fifty percent [50%] double-occupancy) to the area’s population. This number would not be considered large enough to constitute significant growth and would not require infrastructure expansion because the Site already has an underground transformer vault, 3” inch water meter, and 6” sewer lateral stubbed to the Site as it was previously approved for an apartment development as the second phase or an approved residential development.

B.3: The Site is currently developed with one single family home, a garage, barn, wood shed and Christmas tree sales office and shed. The former homestead was grazed in a fire training exercise in 2002 and ancillary farm structures have deteriorated due to the ravages of time. The development of residential housing would not displace any existing housing or require any replacement housing.

Finding. The housing shortage in the City of Mountain View will be eased by the proposed rezoning and development that will provide senior housing thus releasing traditional housing for younger families. No significant negative impacts to population and housing will be associated with the proposed action; therefore, no mitigation is required.

C. TRANSPORTATION / TRAFFIC / PARKING

Will the proposed project result in the following environmental effects?	No Impact	Less Than Significant Impact	Less Than Significant With Mitigation	Potentially Significant Impact
1. Cause an increase in traffic which is substantial in relation to the existing traffic load and capacity of the street system (i.e. result in a substantial increase in either the number of vehicle trips, the volume to capacity ratio on roads, or congestion at intersections)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Exceed, either individually or cumulatively, a level of service standard established by the county congestion management agency for designated roads or highways?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Result in a change in traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5. Result in inadequate emergency access?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
6. Result in inadequate parking capacity?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
7. Conflict with adopted policies, plans, or programs supporting alternative transportation (e.g., bus turnouts, bicycle racks)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

C.1: “One study reported that according to national and local data, less than 5 percent of the [senior] residents owned cars, which were rarely driven. Employees, visitors and delivery trucks made most of the trips to these facilities. ... Although truck traffic was very low overall, most trips occurred during the mid-day period on a weekday.”⁶

Application of trip generation rates published by the Institute of Transportation Engineers (ITE) indicates that a proposed senior assisted housing project would generate on average 226 daily trips, 15 a.m. peak hour trips, and 30 p.m. peak hour trips.⁷ Based on the aforementioned ITE studies, the proposed R4 zoning for a senior assisted living project would generate less than 100 peak hour trips; therefore, a regional traffic analysis consistent with the procedures as outlined in the Santa Clara Valley Transportation Authority’s (VTA) Congestion Management Program (CMP) is not required.

⁶ *Trip Generation*, 8th Edition, Institute of Transportation Engineers, p. 499, pp. 3.

⁷ *Trip Generation*, 8th Edition, Assisted Living Land Use (ITE Code 254) Institute of Transportation Engineers (ITE).

Traffic impact reports performed for other real estate development projects in the immediate vicinity provide an overall perspective of existing capacity for the type of R4 housing development being proposed for this Site. Transportation impact analyses prepared for other residential projects all state that the impact from their specific project, in general as paraphrased from Ryland Homes Transportation Impact Analysis, “would not have a significant adverse impact at any of the study intersections.”⁸ This unanimous conclusion is based on maintaining the City of Mountain View’s minimum acceptable Level of Service (“LOS”) at D (which is a more stringent standard), with LOS E being acceptable for intersections located in and around the Site (e.g., Showers Drive and California Street).⁹

The traffic analyses performed for the following projects assumed there would be at least twenty-five (25) additional dwelling units at Avalon Towers (formerly Skyview Apartments), which was constructed at a lower density than what was used in the analyses, and Korve Engineering’s traffic analysis for the Precise Plan For San Antonio Circle assumed development of this site as C-2 Commercial which it is not (this site was developed into a Community School of Music and Arts [“CSMA”] and the 120 San Antonio Place Efficiency Studios [“SAPES”]). The SAPES traffic impact analysis used existing 2002 conditions with the CSMA in operation plus approved projects in Mountain View and Los Altos contributing to this area and concluded:

“...most of the study area intersections would operate with satisfactory levels of service in the current baseline and baseline plus project conditions, except for San Antonio Road / El Camino Real. This intersection is forecast to operate at LOS F (greater than 60 seconds of delay).”¹⁰

Furthermore, the Meyer, Mohaddes Associates, Inc. analysis as well as other analyses assumed a “Two percent per year ‘background growth’ in traffic demand (due to intensification of non-specific land uses)”¹¹ – this has not occurred but continues to be used in all traffic analyses.

The San Antonio Road/El Camino Real intersection is forecast to operate at LOS F (greater than 60 seconds of delay) in the p.m. peak hour with or without the addition of the proposed senior assisted living project traffic; however, the proposed Merlone-Geier mixed use project will inevitably impact the traffic forecasts.

According to the Initial Study/Mitigated Negative Declaration (Environmental Impact Assessment), Adoption of R4 Multifamily Zoning Designation:

“Future residential development built under the R4 zoning designation would be projected to generate increased traffic volumes because of the increased density allowed by the R4 zoning. Adoption of the R4 zoning designation could, therefore, indirectly increase congestion on roadways and at intersections near the candidate areas. Table 9 shows the additional automobile trips and the increase in morning and afternoon peak hour trips projected with adoption of the R4 zone.

⁸ *Ryland Homes Transportation Impact Analysis*, February 2000 by Fehr & Peers Associates, Inc., p. v, pp. 1.

⁹ Level of Service range from A which is operations with very low delay occurring with favorable progression and/or short cycle lengths to F which is operations with delays unacceptable to most drivers occurring due to over-saturation, poor progression, or very long cycle lengths.

¹⁰

¹¹ *Skyview Apartments Transportation Impact Analysis* by Meyer, Mohaddes Associates, Inc., June 30, 1999, p.28, pp. 1.

The Traffic Analysis studied 25 intersections near the candidate areas and calculated projected changes in the Level of Service (“LOS”) for each of these intersections for both morning and afternoon peak hours using the City's traffic model. The Traffic Analysis forecast changes in LOS from existing conditions to "background"³ conditions projected for the years 2015 and 2025. Additional traffic projected to occur as part of the R4 project was added to these scenarios and the resulting "with project" scenarios were compared to the background conditions to evaluate impacts. Using the City's adopted LOS thresholds to determine impacts, the analysis determined that, with adoption of the R4 zone, there would be no significant impacts during morning or evening peak hours to the levels of service at the 25 intersections studied under either 2015 or 2025 conditions. Summary tables of LOS calculations are presented on the following pages [Tables II.C.1 and II.C.2].

According to the City's CEQA Guidelines, the acceptable LOS for most intersections is LOS D. For intersections that are designated as CMP intersections (part of the Santa Clara Valley Congestion Management Program) and intersections that are in the Downtown and San Antonio Center areas, the acceptable LOS is LOS E. The analysis of a project's traffic impact calculates the resulting intersections' LOS and project's contribution to any decrease in service.

As shown in [Tables II.C.1 and II.C.2], many of the intersections studied are projected to operate under Year 2015 and Year 2025 background conditions at LOS similar to existing LOS. The LOS at several of the intersections are projected to operate at the same LOS under future conditions with implementation of roadway and signal improvements accounted for in the traffic model. While some intersections are expected to experience increased delays and decreases in LOS, none of the intersections studied are expected to operate below acceptable City or CMP standards in 2015 or 2025.

Table [II.C.1] also compares the background 2015 conditions to year 2015 conditions with adoptions of the R4 zone. As shown in the table, all of the intersections function at acceptable LOS under background 2015 conditions. Therefore, with adoption of the R4 zoning designation none of the intersections studied would decrease in LOS in such a way that the decrease would be considered to be a significant impact.

Table [II.C.2] presents a similar comparison of background and with project conditions under the year 2025 scenario. As shown in the table, with adoption of the R4 zoning designation, none of the intersections studied would decrease in LOS in 2025 in such a way that the decrease would be considered to be a significant impact. Therefore, under both year 2015 and 2025 conditions, the project would result in changes with regards to LOS that would be considered to be less-than- significant impacts

Impact: Less than Significant. No Mitigation Required.

Table II.C.1
Summary of 2015 LOS Changes With R4 Zone
[Only Applicable Intersections Are Listed]

Intersection	Existing		Background 2015 LOS		2015 + Project LOS

* =San Antonio Center intersection

**=CMP designated intersection

Source: Korve Engineering, Inc. 2006¹²

Given the aforementioned traffic levels of service analyses, forecasts, and overall conclusions, additional capacity exists for the development of this Site. All transportation impact analyses show, at worst, a LOS of C/C+ for the Showers Drive/California Street intersection (whose standard is LOS E) to LOS A for the Ortega Avenue/California Street intersection; therefore, given the ITE trip generation analysis there should be no reduction in the LOS for surrounding intersections at the proposed R4 zoning designation for the Site.

C.2: As discussed in item C.1, the addition of traffic from the proposed project would not exceed the level of service standards at the study area intersections. An R4 senior assisted housing development would contribute less than one percent of the total traffic volumes at the study area intersections for both a.m. and p.m. peak hours based on the review of aforementioned traffic impact analyses. This addition of project traffic to the study area would be considered nominal when compared to the background traffic volumes and especially in relation to the Merlone-Geier San Antonio Center mixed use project. As indicated in the Santa Clara Valley Transportation Authority's (VTA) Technical Standards and Procedures, a traffic volume increase of one percent or less would not create a significant impact at a Congestion Management Program (CMP) intersection. In addition, although the San Antonio Road/El Camino Real intersection was forecast to operate at LOS

¹² Initial Study/Mitigated Negative Declaration (Environmental Impact Assessment), Adoption of R4 Multifamily Zoning Designation, February 2006, p. 15-18.

F with or without the project; the project would not create a significant impact at this intersection since its contribution would be one percent or less. Therefore, the increase in traffic due to the development of an R4 senior assisted housing development would not significantly alter current and forecast intersection levels of service.

Furthermore, according to the Initial Study/Mitigated Negative Declaration (Environmental Impact Assessment), Adoption of R4 Multifamily Zoning Designation:

“Analysis was conducted on five segments of the primary freeway in Mountain View, US 101, to determine if there would be any project-related deterioration of LOS resulting in additional congestion on the freeway. ...this analysis concluded that new peak hour trips generated during the am and pm peak hours with adoption of the R4 zone would not equal or exceed 1 percent of the freeway capacity. According to Santa Clara County's Congestion Management Program (CMP) guidelines, freeway segments to which a proposed development is projected to add trips during an individual peak hour equal to or greater than 1 percent of the freeway segment's capacity must be evaluated in detail. Because the trips generated in 2015 associated with the R4 zoning designation are not of sufficient quantity to require further analysis of any of the freeway segments studied, impacts to freeway segments are considered to be less than significant.”¹³

C.3, 4, & 5: The Site has existing, lighted sidewalks and signalized intersections along all surrounding streets that provide safe pedestrian and bicycle access to Rengstorff Park to the northeast, the CalTrain San Antonio station to the northwest, and the VTA Regional Bus Terminal and San Antonio Shopping Center to the west. A review of the Site aerial photo shows continuous pedestrian facilities, signalized crosswalks, and clear vehicular lines of sight to meet all safety requirements as required by the City's Traffic Engineering Department. The Initial Study/Mitigated Negative Declaration (Environmental Impact Assessment), Adoption of R4 Multifamily Zoning Designation states that “...the candidate areas would not be anticipated to have a significant affect [sic] on LOS would, therefore, be unlikely to create additional obstructions to emergency response vehicles.”¹⁴ The On-site drive aisles widths and turn radii will be constructed according to the City's Zoning Code standards for passenger cars, service vehicles (i.e., delivery and garbage trucks), and emergency vehicles. Site plans are submitted to the City's Traffic Engineering, Police, and Fire Departments for their review and approval; therefore, there should be no safety hazards from improper design or unsafe materials as these reviews are a necessary part of the approval process.

C.6: According to Chapter 36, §37, of the Mountain View City Zoning Code there is no parking specification for senior assisted living housing. The closest land use is Senior Congregate Care Housing at 1.15 parking spaces per unit (half of which must be covered) and Single Room Occupancies at 1 parking space per unit plus 1 parking space for every nonresident employee; however, a “Reduction of up to 0.50 spaces per unit may be granted through the Conditional Use Permit process.” The R4 Multifamily Development Standards and Guidelines specify 1.5 parking spaces per unit for units under 650 square feet and 2.0 spaces for units over 650 square feet, plus additional guest parking equal to fifteen percent (15%) of the required unit parking; however, the Zoning Administrator has the discretion to allow tandem parking for up to fifty percent (50%) of the residential parking.

¹³ Initial Study/Mitigated Negative Declaration (Environmental Impact Assessment), Adoption of R4 Multifamily Zoning Designation, February 2006, p. 18, pp. 2.

¹⁴ Ibid., p. 19, pp. 5.

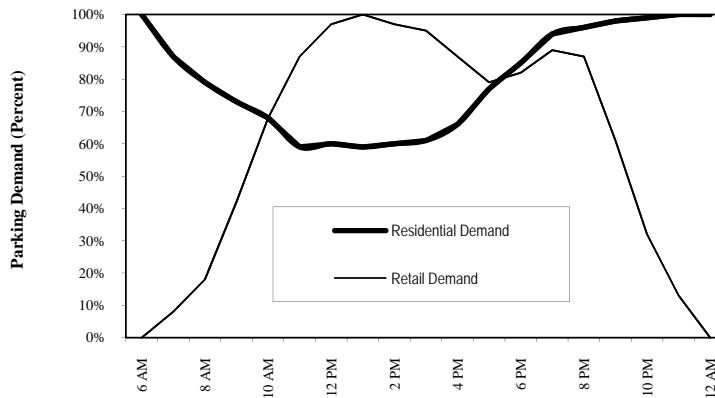

A parking demand analysis was prepared for San Antonio Place by Environmental Science Associates (ESA) in November of 2001, to determine an appropriate parking ratio for the proposed 120-unit efficiency studio housing project. It surveyed four existing efficiency studio housing projects in the adjacent cities and found the highest observed parking demand at a ratio of 0.49 spaces per dwelling unit and the lowest at 0.37 spaces per dwelling unit. All surveyed efficiency studio projects were within close distance to existing transit centers (CalTrain, VTA Bus Routes and Light Rail Train stations) which is the same for this Site.

Since the project proposes a minimum of 85 dwelling units, a minimum of 90 parking spaces would be required under the Single Room Occupancy parking requirement and approximately 100 parking spaces under the Senior Congregate Care Housing parking requirement – either of which can be met with on-site parking. Further reductions could be requested through a parking demand analysis as the Site is within a quarter mile of the VTA Regional Transient Station and within a half-mile of CalTrain San Antonio Station, which given the results for the aforementioned parking study for San Antonio Place that allowed a sixty percent (60%) parking reduction for projects near transit and services or a parking ratio of 0.60 spaces per dwelling unit.

Any concerns of limited on-street parking are further eliminated by the use of the adjacent retail parking lot. According to a Shared Parking Study by the Urban Land Institute peak parking demands for residential and retail uses occur at opposite times of the day. As shown in the chart, based on the weekday parking characteristics of residential and retail uses, the peak parking demand of residential uses typically occurs during the late night and early morning hours, while the peak parking demand for retail uses occurs in the middle of the day.

FIGURE II.C.3

Source: Shared Parking, Urban Land Institute, 1983.

The proposed R4 zoning for senior assisted living will include sufficient parking so that there will be no impacts to on- or off-site parking facilities.

C.7: The development of this Site will not conflict with programs supporting alternative transportation. As previously noted this Site is within easy walking distance of the VTA Regional Bus Terminal, CalTrain San Antonio Station, adjacent to the San Antonio Regional Shopping Center, across the street from Klein Park, and within easy walking distance of Rengstorff Park that provide all the amenities and services required of a residential development.

Finding. No impacts to transportation, traffic circulation or parking are expected and no mitigation is required.

D. NOISE

Will the proposed project result in the following environmental effects?	No Impact	Less Than Significant Impact	Less Than Significant With Mitigation	Potentially Significant Impact
1. Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Exposure of persons to or generation of excessive ground-borne vibration or ground-borne noise levels?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5. For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
6. For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

D.1, 3 & 4: Noise standards are addressed in Title 24 of the *California Code of Regulations* for new multifamily residential developments, local General Plan policies, and local noise ordinance standards, which are enforced through the building permit application process. The two pathways for noise exposure and propagation are:

1. Exposure of sensitive receptors to noise above applicable standards by introducing land uses that are incompatible with the existing noise environment; and/or
2. A project on this Site leading to an increase in ambient noise levels thereby affecting existing sensitive receptors in the vicinity of the Site.

The probability of a project on this Site exposing people to or generating noise levels in excess of General Plan standards according to the aforementioned pathways is negligent to low and only due to adjacent retail loading dock operations. These potential impacts are discussed below.

Compatibility of Site for Proposed Uses

The primary sources of noise that may influence the ambient noise environment at the Site include:

1. CalTrain activity on the railroad tracks located approximately 1,500 feet to the northeast of the Site;
2. Traffic on Central Expressway located another 100 feet beyond the CalTrain tracks;
3. Traffic on California Street (which is at least 80 feet to the north from the Site due to the SFWD R/W);
4. Traffic on El Camino Real located 1,500 feet to the southwest;
5. Occasional aircraft flyovers associated with Moffett Field; and
6. Loading dock operations at Target Store that is immediately adjacent and to the west of the Site.

The proximity of the Site to these noise sources is shown in Figures I.G.1 & I.F.2. The only noise of minimal concern is from the adjacent loading dock operations which can be mitigated through construction techniques (e.g. double pane windows) and building orientation so that the noise has a less than significant impact.

Title 24 State regulations include requirements for the construction of residential developments that are intended to limit the extent of noise transmitted into habitable spaces.¹⁵ For limiting noise from exterior sources, the noise insulation standards set forth an interior standard of DNL 45 dBA in any habitable room and, where such units are proposed in areas subject to noise levels greater than DNL 60 dBA, an acoustical analysis is required demonstrating how dwelling units have been designed to meet this interior standard. If the interior noise level depends upon windows being closed, the design for the structure must also specify ventilation or air-conditioning system to provide a habitable interior environment.

Stationary noise sources such as HVAC will be in operation on the Site. However, such noise is regulated through Equipment Noise Ordinance of the Mountain View Municipal Code, which states that any stationary equipment shall not exceed an hourly Ln of 55 dBA (50 dBA during the night, 10 p.m. to 7 a.m. when measured on any receiving residentially used property). Any plans submitted for building, plumbing, electrical or mechanical/heating permits for any stationary equipment are required to be accompanied by documentation of the equipment noise level when available and by noise mitigating devices or buffers appropriate to achieve the above noise limit.

The 1992 City of Mountain View General Plan contains noise standards for various land uses. For residential uses, the exterior and interior noise standards are shown in Table II.D.1 below.

**TABLE II.D.1
GENERAL PLAN NOISE STANDARDS FOR RESIDENTIAL USES
DNL (dBA)**

Standard	Normally Acceptable	Conditionally Acceptable	Potentially Unacceptable	Normally Unacceptable
Exterior Standards	< 55	55 to 65	65 to 75	> 75
Interior Standards	< 45	45 to 50	50 to 75	> 75

SOURCE: City of Mountain View General Plan, 1992, p. 139.

The General Plan Noise Contour Map indicates exterior noise levels in the vicinity of the Site range between 60 and 65 decibels DNL along California Street. The contour map shows composite noise levels from both CalTrain and roadway noise throughout the City. Noise at these levels is considered “Conditionally Acceptable” with respect to General Plan exterior noise standards for residential uses.

¹⁵ California Code of Regulations, Title 24, Part 2, Appendix Chapters 12 and 12A.
SIDNEY CONSULTING – ORTEGA EIA

With the implementation of mandatory Title 24, construction techniques for noise reduction, and building orientation, the Site will not expose people to or generate noise levels in excess of General Plan noise standards.

Any residential project could generate noise from motor vehicle trips as well as from stationary sources (e.g., HVAC equipment etc.) that could adversely affect nearby noise-sensitive land uses. Traffic noise impacts at nearby sensitive receptors were estimated in prior noise studies (“PNS”) for the Community School of Music and Arts and the San Antonio Efficiency Studios constructed on San Antonio Circle using the Federal Highway Administration’s (FHWA) Noise Prediction Model that showed at most a 1.9 dBA change (Environmental Science Associates, 2001). Each doubling of the sound sources with equal strength would increase the noise level by 3 dBA. A noise increase of 3 dBA is the conservative significance threshold given that most people cannot detect a 3 dBA difference in sound. Using the data in the approved PNS traffic analyses and the FHWA model, project-related traffic would slightly increase roadway noise along California Street and Ortega Avenue during the p.m. peak-hour assuming seniors are driving at this hour, which is debatable.

The noise impact is expected to be less than significant, given that:

1. The existing exterior noise levels at and around the Site are considered “Conditionally Acceptable” according to the General Plan Noise Acceptability Guidelines;
2. A change of at most 1.9 dBA based on PNS for evaluation of operational noise due to project-related traffic; therefore, the increase in roadway noise along California Street and Ortega Avenue is expected to be Less Than Significant Impact; and
3. HVAC equipment to be operated at the Site is subject to the aforementioned City’s noise ordinance standards that provide for the equipment to be designed and used in a manner that complies with those standards, the related noise impact to on-site residents and adjacent land uses would be less than significant.

D.2: A residential use on the Site will not significantly increase noise levels on a permanent basis; however, construction activities may temporarily affect the neighboring property to the south. For non-impact construction equipment, noise levels generally range from between 71 and 90 dBA at a distance of 50 feet from the equipment (Bolt, Beranek & Newman, 1987, Noise Control for Buildings and Manufacturing Plants and EPA, 1971).

It is not known at this time if pile driving will be part of the construction on this Site since the need for pile driving is determined by site-specific engineering studies. Nevertheless, pile driving can generate noise levels of 81 to 96 dBA at a distance of 50 feet (Bolt, Beranek & Newman, 1987, Noise Control for Buildings and Manufacturing Plants). Temporary noise levels of 78 to 93 dBA are therefore possible at the nearest sensitive receptors. Although construction activities will occur during daytime hours, construction noise can be disruptive to residents.

To reduce this impact to less than significant levels, the following measures are required:

1. Construction contractors shall comply with the regulations and construction hour restrictions of the City of Mountain View’s Noise ordinance under §8.23 of the City Code. Construction hours shall be limited to 7 a.m. to 6 p.m. on weekdays. No construction shall be allowed on weekends.
2. Construction contractors shall utilize best management practices for noise reduction, including muffling and shielding intakes and exhausts, shrouding or shielding impact tools, and using electric powered rather than diesel powered construction equipment to the extent feasible.

- Stationary noise sources shall be located as far from sensitive receptors as possible, and they shall be muffled and enclosed within temporary sheds, and shall incorporate insulation barriers, or other measures to the extent feasible.

D.5 & 6: The Site is not within two miles of either a private airstrip or Moffett Airfield but could occasionally be exposed to military aircraft taking-off and landing. However compliance with the aforementioned regulations will reduce the potential impact to a less than significant level.

Finding: Given the implementation of the above mitigation measures and the temporary nature of construction noise, this impact will be mitigated to a less than significant level.

E. AIR QUALITY

Will the proposed project result in the following environmental effects?	No Impact	Less Than Significant Impact	Less Than Significant With Mitigation	Potentially Significant Impact
<i>Where available, the significance criteria established by the applicable air quality management or air pollution control district may be relied upon to make the following determinations.</i>				
1. Conflict with or obstruct implementation of applicable air quality plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
2. Violate any air quality standard or contribute substantially to an existing or projected air quality violation?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. Expose sensitive receptors to substantial pollutant concentrations?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5. Create objectionable odors affecting a substantial number of people?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

E.1 & 2: The City of Mountain View is located in the San Francisco Bay Area that is under the regional governmental agency Bay Area Air Quality Management District (BAAQMD) for regulating sources of air pollution. All developments within BAAQMD's jurisdiction must follow the BAAQMD Rules and Regulations as implemented through the City's standard conditions and approval and as a condition of building permits issuance, construction, and operation.

"On June 2, 2010, the Bay Area Air Quality Management District's Board of Directors unanimously adopted the proposed CEQA thresholds of significance. The thresholds of significance are included in the Air District's updated CEQA Guidelines. All of the adopted CEQA thresholds of significance – except for the risk and hazards thresholds for new receptors – are effective June 2, 2010. The risk and hazards thresholds for new receptors are effective January 1, 2011. It is the Air District's policy that the adopted thresholds apply to projects

for which a Notice of Preparation is published, or environmental analysis begins, on or after the applicable effective date.”¹⁶

The affect of these new CEQA thresholds of significance have not been applied to this proposed rezoning because:

1. According to news articles it effects projects adjacent to major arterials (i.e., freeways) and “the risk and hazards thresholds for new receptors are effective January 1, 2011;”
2. The scope of these new regulations are currently being assessed and addressed by City of Mountain View Community Development Department and will be applied on a City wide basis and may only have limited project specific effects;
3. Those elements that do apply to specific projects will be addressed during permit issuance; and
4. The scope of the proposed R4 rezoning and residential project on a one point six (1.6) acre parcel are deemed minor given the overall scope.

The CEQA thresholds of significance should have only negligible effects and the following analysis is applied under the existing BAAQMD Rules and Regulations because all impacts with the proper mitigations applied are already in place through the construction permit issuance process become less than significant for a development of this size.

Future R4 zoning residential development on this Site will result in more residential units. This in turn may increase resident vehicle trips thus generating additional air pollutants and possible conflicts with applicable air quality plans just like any other residential development albeit to a lesser degree given the senior component to this development and the Sites adjacencies to retail, transit, and recreational amenities.

Even though ozone conditions in the Bay Area have improved significantly there is still a need for continued improvement to meet the new BAAQMD regulations and the State’s one-hour ozone standard.

“In 2006 the U.S. EPA lowered the 24-hour PM_{2.5} standard from 65 µg/m³ to 35 µg/m³. The U.S. EPA designated the Bay Area as nonattainment of the PM_{2.5} standard on October 8, 2009. The effective date of the designation is December 14, 2009 and the Air District has three years to develop a plan, called a State Implementation Plan (SIP), that demonstrates the Bay Area will achieve the revised standard by December 14, 2014. The SIP for the new PM_{2.5} standard must be submitted to the U.S. EPA by December 14, 2012.

The District has adopted a PM Implementation Schedule, per the requirements of SB 656, as discussed below. In 2003 the California Legislature enacted Senate Bill 656 (SB 656, Sher), codified as Health and Safety Code (H&SC) section 39614. This legislation seeks to reduce public exposure to PM 10 and PM_{2.5} and to make progress toward attainment of State and national PM 10 and PM_{2.5} standards. SB 656 required ARB, in consultation with local air quality districts, to develop and adopt a list of the most readily available, feasible, and cost-effective control measures that could be used by ARB and air districts to reduce particulate matter. The bill required the ARB and air districts to adopt implementation schedules for appropriate ARB and air district measures.”¹⁷

¹⁶ www.baaqmd.gov/Divisions/Planning-and-Research/CEQA-GUIDELINES/Updated-CEQA-Guidelines.aspx (visited SEP 25, 2010).

¹⁷ www.baaqmd.gov/Divisions/Planning-and-Research/Plans.aspx (visited SEP 25, 2010)

The San Francisco Bay Area experiences occasional violations of ozone and particulate matter standards. PM-10 is particulate matter that is 10 microns or less in diameter (a micron is one-millionth of a meter) and the 24-hour PM-10 standard is 150 µg/m³. PM-10 represents the fraction of particulate matter that can be inhaled into the air passages and can cause adverse health effects.

Any development on this Site, including the current perennial weed abatement and operation of heavy equipment, affects local pollutant concentrations in two ways:

1. During project construction, as is currently the case with the operation of existing tractors and trucks, dust is generated that is present in local particulate concentrations.
2. Over the long term, any development will result in an increase in regional emissions due to related motor vehicle trips associated with the residential uses that would occupy this Site. The increase in motor vehicle trips would also affect carbon monoxide concentrations along the local road network. However, all of this is based on the existing carbon based vehicles and does not take into account hybrid vehicles or the latest fuel cell technology for electric vehicles that could make carbon based vehicles obsolete.

Any construction on this Site should not take more than eighteen months to complete and conceivably in as little as ten months. Construction projects generate varying degrees of pollutant emissions through the use of products consumed in the actual construction of the project and dust through the operation of heavy machinery and construction worker trips to and from the Site.

“Additional pollutant emissions would be released by solvents found in products used in construction, such as adhesives, paints, thinners, some insulating materials, and caulking materials. These solvents generally evaporate into the atmosphere and participate in the photochemical reaction that causes ozone. Asphalt paving is also a source of reactive organic gases (ROG) emissions. Criteria pollutant emissions of ROG and nitrogen oxides (NO_x) from these emission sources would incrementally add to the regional atmospheric loading of ozone precursors during construction activities. However, emissions of carbon monoxide (CO) and ozone precursors (ROG and NO_x) from exhaust and other construction activities are included by the BAAQMD in the emission inventory that is the basis for regional air quality planning, and the BAAQMD does not consider these emissions to impede attainment or maintenance of ambient air quality standards. Therefore, emissions created during construction of residential units under the R4 zoning designation would not be considered to cause additional emissions that would impede attainment or maintenance of ozone standards in the Bay Area. Any impacts to air quality during construction would, therefore, be less than significant.”¹⁸

Dust is generated (including PM-10) from “fugitive” sources, such as earthmoving activities and vehicle travel over unpaved surfaces, and lesser amounts of other criteria pollutants from the operation of heavy equipment construction machinery (primarily diesel operated) and construction worker automobile trips (primarily gasoline operated). Construction-related dust emissions significantly vary from day to day, depending on the level and type of activity, silt content of the soil, and the weather.

¹⁸ *Initial Study/Mitigated Negative Declaration (Environmental Impact Assessment), Adoption of R4 Multifamily Zoning Designation*, February 2006, p. 19, pp. 6.
SIDNEY CONSULTING – ORTEGA EIA

Construction activities may result in significant quantities of dust, and this may affect local visibility and PM-10 concentrations may be adversely affected on a temporary basis during the construction period. In addition, larger dust particles would settle out of the atmosphere close to the construction site resulting in a potential soiling nuisance for adjacent uses.

For construction phase impacts, the Bay Area Air Quality Management District (BAAQMD) recommends that significance be based on a consideration of the control measures to be implemented. Generally, if appropriate measures are implemented to reduce fugitive dust, then the residual impact can be presumed to be less than significant. Without these measures, the impact is generally considered to be significant, particularly if sensitive land uses (e.g., residential) are located in the Site's vicinity. In this instance, residential uses are located immediately south of the project site, and thus, without appropriate dust mitigation, the effect may be significant.

During construction, the project sponsor shall require the construction contractor to implement the following dust abatement program, which is the BAAQMD recommendations for construction sites, such as this Site, that are smaller than 4 acres in size:

1. Water all construction areas at least twice a day.
2. Cover all trucks hauling soil, sand, and other loose materials or require all trucks to maintain at least two feet of freeboard.
3. Pave, apply water three times daily, or apply (non-toxic) soil stabilizers on all unpaved access roads, parking areas and staging areas at construction sites.
4. Sweep daily (with water sweepers) all paved access roads, parking areas and staging areas at construction sites.
5. Sweep streets daily (with water sweepers) if visible soil material is carried onto adjacent public streets.

With implementation of this measure, project construction should not expose sensitive receptors to high pollutant concentrations.

With respect to the operational-phase of a residential complex, there should be no proposed stationary sources that would be subject to BAAQMD's Rules and Regulations. Emissions associated with a proposed project are primarily from the increase in motor vehicle trips. Emissions from area sources such as space heating and landscaping are also expected to be minimal. The BAAQMD generally does not recommend a detailed air quality analysis for projects generating less than 2,000 vehicle trips per day as projects of this size are not expected to generate criteria pollutant emissions more than the 80 pounds per day significance thresholds recommended by the district. The proposed development of a senior assisted living facility would generate an average of 226 trips per day. This means that emissions caused by vehicle trips associated with this type of project will not create criteria pollutant emissions greater than the BAAQMD's thresholds of significance: therefore, project emissions would not lead to or contribute to an existing air quality violation.

E.3: Construction activities could expose sensitive receptors to substantial pollutant concentrations, principally PM-10, from fugitive dust sources. The nearest sensitive receptors are located south of the Site. However, with the implementation of the aforementioned dust abatement program, this impact would be reduced to a less than significant level. Operationally, motor vehicles would be the primary source of local pollutant emissions that could affect sensitive receptors. Carbon monoxide emissions from the project related traffic is expected to be well below the screening threshold of 550 pounds per day recommended by the air district. Therefore this would be a less than significant impact.

E.4: The Bay Area is currently designated as a nonattainment area for the state and national ozone standards and as a nonattainment area for the state respirable particulate matter standard (PM-2.5 & PM-10). The San Francisco Bay Area Ozone Attainment Plan for the 1-Hour National Ozone Standard and the Bay Area Clean Air Plan have been prepared to address ozone nonattainment issues. No PM-10 plan has been prepared or is required under the State Air Quality Planning Law. Both the federal and state ozone plans rely heavily upon stationary source control measures set forth in the BAAQMD's Rules and Regulations. The overall stationary source control program that is embodied by the BAAQMD Rules and Regulations has been developed such that new stationary sources can be allowed to operate in the Bay Area without obstructing the goals of the regional air quality plans.

With respect to the construction phase of the project, applicable BAAQMD Regulations would relate to portable equipment (e.g., carbon fuel powered engines used for power generation, pumps, compressors, pile drivers, and cranes), architectural coatings, and paving materials.

With respect to the operational-phase of the project, there are no proposed stationary sources that would be subject to BAAQMD's Rules and Regulations. To ensure compliance with applicable BAAQMD requirements, the project contractor will be required to comply with BAAQMD Regulations. These include but are not limited to: Regulation 2 (Permits); Rule 1 (General Requirements) with respect to portable equipment unless exempt under Rule 2-1-105 (Exemption, Registered Statewide Portable Equipment); and demonstrate compliance with BAAQMD Regulation 8 (Organic Compounds), Rule 3 (Architectural Coatings), and Rule 15 (Emulsified and Liquid Asphalts).

Emissions associated with a proposed project would primarily be from the increase in motor vehicle trips. Emissions from area sources such as space heating and landscaping are also expected to be minimal. As discussed earlier, projects that generate less than 2,000 vehicle trips per day are not expected to exceed the 80 pounds per day significance threshold recommended by the BAAQMD. The proposed project would generate an average of 226 trips per day. This means that emissions caused by vehicle trips associated with the Site would not create criteria pollutant emissions greater than the BAAQMD's thresholds of significance. Therefore project emissions would not conflict with or obstruct implementation of the applicable air quality plans for the Bay area.

E.5: A residential project constructed and operated on this Site should not create objectionable odors affecting a substantial number of people on an on-going basis, just as any other residential project does not create objectionable odors on an on-going basis.

Finding. Implementation of the mitigation measure listed above would reduce potential air quality impacts to less than significant levels.

F. HYDROLOGY AND WATER QUALITY

Will the proposed project result in the following environmental effects?	No Impact	Less Than Significant Impact	Less Than Significant With Mitigation	Potentially Significant Impact
1. Violate any water quality standards or waste discharge requirements?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Substantially deplete groundwater supplies or interfere substantially	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

- | | | | | |
|---|-------------------------------------|--------------------------|--------------------------|--------------------------|
| 3. Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site? | <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| 4. Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site? | <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| 5. Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff? | <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| 6. Otherwise substantially degrade water quality? | <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| 7. Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map? | <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| 8. Place within a 100-year flood hazard area structures which would impede or redirect flood flows? | <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| 9. Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam? | <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| 10. Inundation by seiche, tsunami, or mudflow? | <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| 11. Conflict with City of Mountain View's Water Conservation Program? | <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |

F.1, 3, 4 & 6: The Site is approximately forty percent (40%) covered by impervious buildings, concrete and hard-packed rock – the remainder being porous, cultivated soil. Any development would incrementally increase the amount of impervious surface area and the amount of surface runoff; however, R4 Development Standards require a minimum of thirty (30%) percent in open space and the storm water runoff is governed by a National Pollution

Discharge Elimination System (“NPDES”) permit issued by the San Francisco Bay Regional Water Quality Control Board (“SFBRWQCB”) and is enforced through the City of Mountain View construction permit issuance as it is one of the founding public agencies to the successor in interest that is now known as the Santa Clara Valley Urban Runoff Pollution Control Prevention Program (“SCVURPPP”). The NPDES permit requires that new development be regulated to minimize the potential degradation of water quality during construction and for the long-term operation of the Site, thus reducing any potential impacts to water quality to a less than significant level.

Grading activities associated with the construction of the building pads and foundations could alter existing surface and/or subsurface drainage patterns. To address potential drainage impacts, the construction contractor would be required to abide by standard City’s Best Management Practices for grading as required by Mountain View Municipal Code §35.32.10 (T). Best Management Practices are cost-effective practices which comply with storm water discharge regulations and are accepted by the City of Mountain View and the SCVURPPP nonpoint source discharge program for minimizing discharges of polluted water or industrial waste to the storm or sanitary sewer system thereby protecting water quality in streams, the groundwater basin, and the San Francisco Bay. A grading plan is required as a component of the application process for building permits. City practices assure that final grading of the site achieves positive surface and subsurface drainage in the same direction as existing natural drainage. With the implementation of these standard practices, no drainage or surface water runoff impacts are expected.

F.2: The proposed project does not have the potential to alter the amount of groundwater by direct additions or withdrawals. Approximately eighty seven (87%) percent of the City of Mountain View’s water is purchased from the City of San Francisco Department of Water known as Hetch Hetchy. The Hetch Hetchy water is blended with groundwater from five City wells. About ten (10%) percent of the City’s water supply comes from the Santa Clara Valley Water District with the remainder from the California Water Service Company.

F.4: Although site-specific project details are not currently available, it is not anticipated that future residential development built under the R4 zoning designation would substantially change the rate and amount of water flows since the Site is currently developed with existing curb, gutter, and storm water drain lines along both California Street and Ortega Avenue. These existing facilities were constructed with the anticipated development of an apartment complex and the 75-unit adjacent residential development known as Hastings Square West. Therefore, groundwater quality will not be affected by infiltration of storm water runoff since the Site is served by the City of Mountain View’s storm water collection system.

F.5: A major source of water quality deterioration is “non-point source” pollution, which results from urban runoff. Urban runoff is typically contaminated by oil and grease from parking areas and roads, sediments from construction related activities, pesticides and fertilizers from landscaping, and lead or other heavy metals from vehicles.

Construction activities may contribute to the contamination of surface runoff and groundwater. Contamination can be reduced to less than significant levels by following the City’s Best Management Practices as required for grading impacts, construction, and long-term Site operation (see discussion under item F.1, 3, 4 & 6); therefore, no significant water quality impacts are anticipated.

F.7 & 8: The Federal Emergency Management Agency’s (FEMA) produces Flood Hazard Area Maps that show the 100-year flood hazard area wherein there is a one (1%) annual

chance of flooding and the 500-year flood hazard area wherein there is point two (0.2%) percent annual chance of flooding or where an area inundated by one (1%) annual flooding with average depths of less than 1 foot or with drainage areas less than one (1) square mile. According to the FEMA 2008 Flood Hazard Areas Map, the Site is outside of the 100-year flood hazard zone but is in the 500-year flood hazard zone which is not deemed significant. In terms of sea level rise from global climate change, the Site is approximately 100' feet above sea level; therefore, there is no immediate effect. The development of the Site will not place its residents within a 100-year Flood Hazard Area or from sea level rise due to global climate change.

F.9: The Site is not subject to flooding from the failure of a dam or its tributary or levee as there are no such features or structures in the vicinity of this Site.

F.10: The Site is approximately three miles from the San Francisco Bay and approximately 100 feet above sea level, on flat land and there are no bodies of water nearby; therefore, there is no risk from seiche, tsunami, or mudslides.

Finding: Compliance with the requirements of the RWQCB, NPDES, and the City Best Management Practices will reduce any potential impacts to water quality to a Less Than Significant Level; therefore, no significant hydrology impacts are expected and no mitigation is required other than as required as a matter of law.

G. GEOLOGY & SOILS

Will the proposed project result in the following environmental effects?	No Impact	Less Than Significant Impact	Less Than Significant With Mitigation	Potentially Significant Impact
1. Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
ii) Strong seismic ground shaking?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
ii) Seismic-related ground failure, including liquefaction?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
iv) Landslides?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Result in substantial soil erosion or the loss of topsoil?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence,	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

liquefaction or collapse?

- | | | | | |
|--|--------------------------|-------------------------------------|--------------------------|--------------------------|
| 4. Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property? | <input type="checkbox"/> | <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| 5. Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater? | <input type="checkbox"/> | <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |

G.1: The Site is located in the San Francisco Bay Area, a region of intense seismic activity. Recent studies by the United States Geological Survey (USGS) indicate that there is a seventy (70%) percent probability of a Richter magnitude 6.7 or greater earthquake in the Bay Area in the next thirty (30) years. An earthquake occurring on either the San Andreas or Hayward faults could result in severe ground shaking and seismic settlement in Mountain View. To address potential impacts from seismic activity, the City requires soils reports for all new buildings to identify construction techniques necessary to comply with the earthquake protection standards in the Uniform Building Code.

The Site is not located in an Alquist-Priolo Earthquake Fault Zone as defined by the California State Department of Conservation, Division of Mines and Geology (CDMG). Alquist-Priolo Zones designate areas most likely to experience fault rupture, although surface fault rupture is not necessarily restricted to those specifically zoned areas.

The Site is not immediately adjacent to an active or potentially active fault. An active fault is defined by the State of California as a fault that has had surface displacement within Holocene time (approximately within the last 10,000 years). A potentially active fault is defined as a fault that has shown evidence of surface displacement during the Quaternary (last 1.6 million years), unless direct geologic evidence demonstrates inactivity for all of the Holocene or longer. This definition does not mean that faults lacking evidence of surface displacement are necessarily inactive. Sufficiently active is also used to describe a fault if there is some evidence that Holocene displacement occurred on one or more of its segments. (Hart, 1997) The City of Mountain View is situated about six miles east of the San Andreas Fault and ten miles west of the Hayward Fault. The Site is not located on an active or potentially active fault; therefore, it is highly unlikely that a project would expose people to fault rupture and the impact is considered less than significant.

The 1992 General Plan Geologic Hazard Zones Map indicates that the Site is located in Zone F, which has a low potential for liquefaction or differential settlement in the event of a large magnitude earthquake. Liquefaction and subsidence generally occur in loose saturated sands. The 2009 California Geological Survey Seismic Hazard Zones of Required Investigation map shows that this Site is not in an area where historical occurrence of liquefaction, or local geological geotechnical and ground-water conditions indicate a potential for permanent ground displacements such that mitigation as defined in Public Resources Code §2693(c) is required. Therefore, the potential for liquefaction, subsidence, and landslide is extremely low and the impact is considered less than significant.

G.2 & 4: Soil exposed by grading and construction activities could be subject to erosion by heavy winds or rain but no more than currently exists with the operation of heavy equipment and the annual disking of volunteer weeds. During construction of new buildings there is a potential for wind erosion and introduction of particulate matter into the atmosphere,

changes in topography, and unstable soil conditions. A site condition of approval for new development will be compliance with the City's Best Management Practices for construction. These practices include watering during grading activities and cleaning dust and debris associated with construction as noted in the Santa Clara Valley Nonpoint Source Pollution Control Program's document entitled "Blueprint for a Clean Bay."

G.3: The Site is relatively flat and is not adjacent to any steep slopes. Based on the location of the Site and its surrounding geological features, people and property will not be exposed to landslides or mudslides.

G.5: The 1992 General Plan Geologic Hazard Zones Map indicates that the Site is located in Zone F (see G.1 & 3 discussion). This zone has a low potential for liquefaction or differential settlement in the event of a large magnitude earthquake; therefore, the potential for liquefaction, subsidence, and landslide is extremely low and the impact is considered less than significant.

Finding. No significant geophysical impacts are expected from the proposed development of this Site and no mitigation is required beyond the City of Mountain View's requirements for soils reports and compliance with Best Management Practices.

H. BIOLOGY

Will the proposed project result in the following environmental effects?	No Impact	Less Than Significant Impact	Less Than Significant With Mitigation	Potentially Significant Impact
1. Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Have a substantial adverse effect on Federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5. Conflict with any local policies or	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

ordinances protecting biological resources, such as a tree preservation policy or ordinance?

6. Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

H.1: The Site is underdeveloped and located in an urbanized area that is surrounded by existing retail/commercial and high-density residential development. The Site is located in an “Urban Developed” habitat as defined in the 1992 City of Mountain View General Plan and there are no endangered, threatened or rare species present.

H.2, 5 & 6: The City of Mountain View gives special protection to trees classified as Heritage Trees. Heritage Trees are characterized as trees that meet the following criteria (Mountain View City Code, Chapter 32 Trees, Shrubs and Plants, Article II Protection of the Urban Forest, §23):

1. “A tree which has a trunk with a circumference of forty-eight (48) inches or more measured at fifty-four (54) inches above natural grade;
2. A multi-branched tree which has major branches below fifty-four (54) inches above the natural grade with a circumference of forty-eight (48) inches measured just below the first major trunk fork.
3. Any quercus (oak), sequoia (redwood), or cedrus (cedar) tree that is twelve (12) inches or more in circumference when measured at fifty-four (54) inches above natural grade;
4. A tree or grove of trees designated by resolution of the City Council to be of special historical value or of significant community benefit.”

A tree survey was conducted for the Site that indicates there are forty-two (42) existing trees on the Site, as well as other trees and vegetation surrounding the Site and volunteer seedlings along the masonry wall that are periodically removed in order to preserve the integrity of the wall. As indicated in the table below, due to the size and species of the existing on-site trees, nineteen (19) trees meet the requirements for a Heritage Tree designation but just about all are volunteer trees and in poor condition due to age and lack of maintenance. Furthermore, the City of Mountain View has not designated any of the trees on the Site to be of special historical value or community benefit.

The following is a brief evaluation of the trees on the Site:

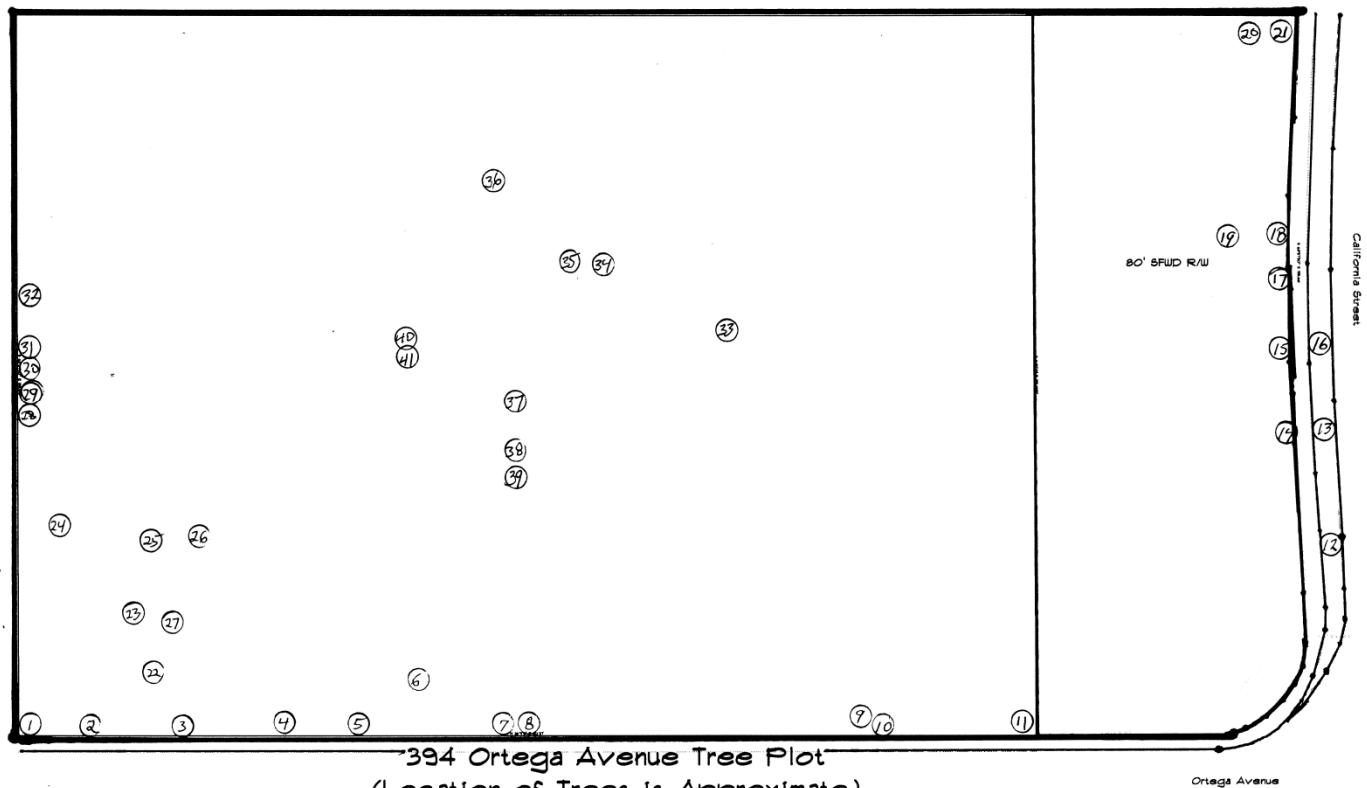

**TABLE II.H.2
ORTEGA TREE SURVEY**

Tree #	Species	Condition	Trunk Circumference (Inches)	Height (Feet)	Spread (Feet)
1	Japanese Privet (<i>Ligustrum Japonicum</i>)	Excellent	50	20	18
2	Maple (<i>Acer Platanoides</i>)	Fair	25	15	13.5
3	Maple (<i>Acer Platanoides</i>)	Fair - Multiple Trunks	21	15	14
			29

**TABLE III.H.2
ORTEGA TREE PLOT**

Source: Sidney Consulting

Removal permits are required for the removal of Heritage trees in order to facilitate new construction, development, renovation or redevelopment and are filed with the Community Development Department. The application is filed and processed concurrent with any other application(s) for development entitlements. Approval of an application for a permit may include reasonable conditions to insure compliance with the content and purpose of Mountain View's Article II, *Protection of the Urban Forest*, such as, but not limited to:

1. Requiring the replacement or placement of an additional tree or trees on the subject property to offset the loss of a tree, limbs, or encroachment into the drip line.

2. Construction of fencing or barriers to protect adjacent heritage trees or other landscaping;
3. Specification of protective grading requirements to avoid damaging the root structure of Heritage trees;
4. Posting of a security bond to ensure that replacement trees are planted and become established (one [1] year after planting) and to compensate for the lost trees due to illegal removal;
5. The relocation of a tree on- or off-site, or the planting of a new tree on- or off-site, in order to offset the loss of a Heritage tree;
6. Payment of a fee or donation of a boxed tree(s) to the city or other public agency to be used elsewhere in the community should a suitable replacement location of the tree not be possible on-site or off-site. The fee for replacement of a tree or trees shall be, at a minimum, based on the cost of a twenty-four (24) inch boxed tree of same species, delivered and installed. (Ordinance No. 10.96, September 24, 1996)

Specific conditions required as part of the approval process will be determined by the Zoning Administrator. Development of the Site will require removing some existing trees but will also include landscaping within and around the perimeter of the Site that would include new plantings of drought tolerant trees, bushes, and shrubs.

H.3: There are no wetlands or riparian habitat in the vicinity of this Site.

H.4: The Site does not contain any biological resources and is not near any streams, creeks or other riparian resources or wildlife corridors. The Site is partially developed and is surrounded by a highly urbanized environment; therefore, development of this Site would not affect wildlife corridors.

Finding. No significant biological impacts are anticipated and no mitigation is required at this time.

I. HAZARDS & HAZARDOUS MATERIALS

Will the proposed project result in the following environmental effects?	No Impact	Less Than Significant Impact	Less Than Significant With Mitigation	Potentially Significant Impact
1. Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

proposed school?

- | | | | | |
|--|-------------------------------------|--------------------------|--------------------------|--------------------------|
| 4. Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment? | <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| 5. For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area? | <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| 6. For a project within the vicinity of a Private airstrip, would the project result In a safety hazard for people residing or Working in the project area? | <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| 7. Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan? | <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| 8. Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands? | <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |

1.1 & 2: The proposed residential development will use limited hazardous materials that are expected to be consumed by on-site use, and therefore, would not create a new hazard. As discussed in the Air Quality section of this report, the construction phase of the project may create temporary health hazards stemming from the introduction of particulate matter into the atmosphere; however, this potential hazard would be mitigated through the application of City of Mountain View's Best Management Practices for dust control.

1.3 & 4: As previous stated an established residential development's use of hazardous materials will be consumed by on-site use and it will not emit hazardous emissions or handle hazardous materials.

The firm Environmental Record Search identified three sites within a quarter of a mile with "active environmental permits or have had contamination and/or hazardous materials on-site in the past," and five more sites in the vicinity of Mora Drive that is over a quarter mile and down gradient from the Site. Sidney Consulting is only aware of the Mora Drive sites and the former gasoline compounds contamination by Showers Drive and California Street that is now a closed case. The contaminated sites listed by Environmental Record Search pose no threat to the Site because:

1. Of the distance to these contaminated sites;
2. Direction of groundwater gradient flow towards the SF Bay (i.e., away from the Site); and
3. The known existence of these sites for over twenty years (i.e., these are not new).

Pursuant to the intent of Government Code §65962.5, this Site is not listed and will not be affected by the aforementioned sites.

I.5 & 6: The Site is not located within an airport land use plan or within two miles of an airport and poses no safety hazard to an airport or aircraft overflights and the Site is surrounded by three to ten story buildings on the southern and northern sides.

I.7: The City’s Fire Department and Traffic Division of the Public Works Department will evaluate a proposed residential project as part of the normal permitting procedure. Given the structures in the immediate vicinity and no identified emergency issues, the proposed use should not interfere with any emergency response or evacuation plan.

I.8: The Site is situated in urban environment that does not adjoin large open areas with flammable vegetation that would put people and structures at risk from wild-land fires. Development of this Site will not expose people or structures to wildfires hazards.

Finding. No significant health hazards are expected from the development of this Site; therefore, no mitigation is required.

J. PUBLIC SERVICES

Will the proposed project result in the following environmental effects?	No Impact	Less Than Significant Impact	Less Than Significant With Mitigation	Potentially Significant Impact
1. Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:				
a. Fire protection?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b. Police protection?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c. Schools?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d. Parks?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e. Other public facilities?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

J.1a: The Mountain View Fire Department’s (“MVFS”) staff levels are sufficient to support the proposed development of this Site at an R4 residential zoning. The Initial Study/Mitigated Negative Declaration (Environmental Impact Assessment) Adoption of R4 Multifamily Zoning Designation states: “...while demand for fire protection services would increase slightly, the increase would not result in the need for new or altered service and would not result in any significant impacts.”¹⁹ The City’s General Plan states that the Fire Protection Master Plan will continue to be evaluated and updated, a program of inspections and site plan review will continue to be maintained and necessary personnel and equipment will continue to be provided. The proposed Site development is not likely to have a significant impact on fire prevention and fire suppression services as the MVFD has the staff and equipment for responding to high-rise fires. Implementation of Uniform Fire Code

¹⁹ Initial Study/Mitigated Negative Declaration (Environmental Impact Assessment), Adoption of R4 Multifamily Zoning Designation, February 2006, p. 50, pp. 1.

requirements for new construction will reduce potential impacts to less than significant levels.

J.1b: The Initial Study/Mitigated Negative Declaration (Environmental Impact Assessment) Adoption of R4 Multifamily Zoning Designation states: "...while demand for police services would increase slightly, the increase would not result in the need for new or altered service and would not result in any significant impacts."²⁰ The goal of the Mountain View Police Department is to maintain a force sufficiently staffed and deployed to sustain four-minute maximum emergency response seventy percent (70%) of the time. Demand for police services would not be affected by the proposed Site development.

J.1c: The Site is in the Los Altos School District and the Mountain View-Los Altos Union High School District but since it is a senior housing development there will be no students.

J.1d: According to the City of Mountain View 2008 Parks and Open Space Plan, the overall San Antonio Area bounded by Central Expressway, the Palo Alto border, El Camino Real and Escuela Avenue is one of the highest Open Space Land Uses at 3.6% and the highest Park Use at 55 Persons Per Residential Acre or 1.71 Open Space Acres Per 1,000 Residents. The area most in need of parks is also isolated from the parks in this planning area that is to the north of the Site and is bounded by San Antonio Road, California Street, Rengstorff Avenue, and Central Expressway. The aforementioned statistics do not communicate this area's geographical isolation or that this Site is directly across Ortega Avenue from the 1.36 acre Klein Mini-Park and approximately 1,490 feet to the west of the 16.92 acre Rengstorff Community Park; therefore, the Site is extremely well situated for the use of these amenities and the Park Land Dedication Fee was paid as required under a previously approved apartment development permit. There are no impacts.

J.1e: The residential development of this Site will not affect maintenance services in excess of that previously considered by the General Plan and does not have the potential to affect governmental services or create a need for new facilities. Furthermore, all public services to the Site are adequately sized for an R4 residential development and the Public Works fees have been paid as required under a previously approved apartment development permit.

Finding. No significant impacts to public services are expected and no mitigation is required.

K. UTILITIES AND SERVICE SYSTEMS

Will the proposed project result in the following environmental effects?	No Impact	Less Than Significant Impact	Less Than Significant With Mitigation	Potentially Significant Impact
1. Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

²⁰ Initial Study/Mitigated Negative Declaration (Environmental Impact Assessment), Adoption of R4 Multifamily Zoning Designation, February 2006, p. 50, pp. 2.
SIDNEY CONSULTING – ORTEGA EIA

effects?

- | | | | | |
|---|-------------------------------------|-------------------------------------|--------------------------|--------------------------|
| 3. Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects? | <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| 4. Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed? | <input type="checkbox"/> | <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| 5. Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the projects projected demand in addition to the providers existing commitments? | <input type="checkbox"/> | <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| 6. Be served by a landfill with sufficient permitted capacity to accommodate the projects solid waste disposal needs? | <input type="checkbox"/> | <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| 7. Comply with federal, state, and local statutes and regulations related to solid waste? | <input type="checkbox"/> | <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |

K.1 & 5: Development of this Site will not exceed the Palo Alto Regional Water Quality Control Plant (“PARWQCP”) wastewater requirements/capacity. The PARWQCP operates as a tertiary treatment facility serving the communities of Mountain View, Palo Alto, Los Altos, Los Altos Hills, Stanford University, and East Menlo Park. Records show a trend toward a decrease in per capita sewage generation, believed to directly result from water conservation programs and the relocation of chip manufacturers out of the service area.

“Mountain View currently generates about 8.4 MGD [Million Gallons Per Day] of wastewater, which is only 56 percent of the allocation of the City’s wastewater from the PARWQCP. Mountain View’s total wastewater is projected to reach 11.0 MGD by 2025, which is still within the City’s 15.1 MGD wastewater capacity allotted by the PARWQCP.”²¹

The Site has a high capacity sanitary line stubbed and capped at the property line and the City of Mountain View Public Works Sanitary Sewer Main fees have been paid for the development of apartments. These services are sufficient to serve an R4 development on the Site without the need for capacity improvements.

K.2: Potable water is supplied to the Site by an existing 3” Water Meter in place and capped that was installed for the construction of apartments and the City of Mountain View Public Works Water Main Facility fee was paid in full as required. These services are sufficient to serve an R4 development of the Site without the need for additional capacity improvements.

K.3: The storm water collection system on Ortega Avenue (i.e., curb, gutter, and storm water lateral) is installed and the City of Mountain View Public Works Storm Drain Contribution fee was paid per City of Mountain View Resolution 9970 for the development of

²¹ *Initial Study/Mitigated Negative Declaration (Environmental Impact Assessment), Adoption of R4 Multifamily Zoning Designation*, February 2006, p. 54, pp. 1.
SIDNEY CONSULTING – ORTEGA EIA

apartment homes. Storm water collection already exists on California Street. Development of the Site is expected to produce the same or less than what is currently produced because of the 2004 Santa Clara Valley Urban Runoff Pollution Prevention Program that enforces the National Pollution Discharge Elimination System permit issued by the San Francisco Bay Regional Water Quality Control Board; therefore, the existing system adequately conveys storm water runoff from the Site and streets into the San Francisco Bay and with installation of on-site storm water runoff mitigation there will be no impact on storm water runoff infrastructure.

K.4: The proposed project population increase of 85 to 128 residents for a proposed R4 senior living development will not result in a significant increase in water demand. The Initial Study/Mitigated Negative Declaration (Environmental Impact Assessment), Adoption of R4 Multifamily Zoning Designation, states:

“...it is estimated that the additional 675 residential units projected over the next 20 years with adoption of R4 zoning would result in a water demand increase of approximately 116,775 gpd (0.12 MGD). The additional increase would be approximately 0.8 percent of the total allocation for the City.”²²

According to Gregg Hosfeldt, Assistant Public Works Director:

“Because the City continues to implement water conservation programs and increase use of recycled water, Mountain View’s water supply appears to be adequate to meet anticipated demands for the next 5 to 10 years.”²³

The impact is less than significant due to the small population increase and the current supply of water as well as the Bay Area Water Supply and Conservation Agency’s water conservation program and on-going study for new water supplies given the San Francisco Public Utilities Department water supply restriction.

K.6 & 7: Assembly Bill (AB) 939, The California Integrated Solid Waste Management Act of 1989, required that all waste disposals in landfills be reduced by fifty percent (50%) by the year 2000. The City of Mountain View introduced its Source Reduction Program in 1991, predicting a fifty percent (50%) reduction by 2000.

Foothill Disposal Company, a division of Norcal Waste Systems, Inc., currently provides solid waste disposal services to the Site and there is no cap on the amount of waste that Foothill Disposal is responsible to collect. Foothill Disposal delivers solid waste to the SMaRT Station in the City of Sunnyvale that is owned by the Cities of Mountain View, Palo Alto, and Sunnyvale. At the SMaRT Station over fifty percent (50%) of the solid waste is diverted and processed, and the remaining garbage is sent to the Kirby Canyon Landfill. Santa Clara County provides hazardous waste services for residents.

“The California Integrated Waste Management Board's Jurisdictional Profile for the City of Mountain View estimates residential waste in the City at 2.0 pounds per person per day after diversions.”²⁴ The proposed project will have between 85 and 128 residents. At 128 residents this equates to at most 41.6 tons of solid waste that is 0.00076% of the City of

²² *Initial Study/Mitigated Negative Declaration (Environmental Impact Assessment), Adoption of R4 Multifamily Zoning Designation*, February 2006, p. 53, pp. 2.

²³ Gregg Hosfeldt, Assistant Public Works Director, *Mountain View Water Supply Update Memorandum*, dated September 15, 2010, p.2 pp.3.

²⁴ *Initial Study/Mitigated Negative Declaration (Environmental Impact Assessment), Adoption of R4 Multifamily Zoning Designation*, February 2006, p. 55, pp. 8.

Mountain View's total annual solid waste generation of 54,463 tons; therefore, the proposed R4 zoning will have a less than significant impact on solid waste disposal.

Finding. No impacts to utilities or service systems are expected and no mitigation is required.

L. RECREATION

Will the proposed project result in the following environmental effects?	No Impact	Less Than Significant Impact	Less Than Significant With Mitigation	Potentially Significant Impact
1. Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

L.1: According to the City of Mountain View 2008 Parks and Open Space Plan, the overall San Antonio Area bounded by Central Expressway, the Palo Alto border, El Camino Real and Escuela Avenue is one of the highest Open Space Land Uses at three point six percent (3.6%) and the highest Park Use at 55 Persons Per Residential Acre or 1.71 Open Space Acres Per 1,000 Residents. However, these statistics do not communicate that the Site is directly across Ortega Avenue from Klein Mini-Park and approximately 1,490 feet to the west of Rengstorff Community Park. The area most in need of parks is isolated from the aforementioned parks and is to the north of the Site, bounded by San Antonio Road, California Street, Rengstorff Avenue, and Central Expressway.

The 1.36 acre Klein Mini Park that is directly across the street offers a playground for the toddlers, a basketball court for the athletic, walkways for the young at heart, tables and benches for those who prefer to meet and confer or simply read, and a pleasant passive area for those who prefer to reflect.

The 27.3 acre Rengstorff Community Park, Community Center, Senior Center, Child Care Center, Community Garden, and La Avenidas offers a full assortment of amenities and structured adult and children activities, including but not limited to: an auditorium with meeting rooms; barbecue facilities and picnic area; baseball, softball, and soccer fields; children's play equipment; swimming pool; basketball, tennis, and volleyball courts; and public restrooms.

The City of Mountain View 753 acre Regional Shoreline Park is a recreation area and wildlife preserve that is approximately two miles north of the Site that features an 18-hole Robert Trent Jones II designed championship golf course, a sailing lake, quality restaurants, and miles of hiking trails and picnic areas. The nearby 25,000-person capacity Shoreline Amphitheatre offers a concert and event venue that draws people from around the San Francisco Bay Area and beyond for professional and international performances. Shoreline Amphitheatre hosts approximately 40 plus shows per season attended by approximately 700,000 people. To the south of the Site is the coastal mountain range providing not only spectacular vistas but miles upon miles of hiking trails and open space. The Mid-Peninsula

Open Space district maintains most of these areas which are open to public from sunrise to sunset, with the closest park being Rancho San Antonio, a mere ten minute drive at most!

The City of Mountain View’s Park Land Dedication Ordinance requires the dedication of 3 acres of open space for every increase of 1,000 residents or payment of an equivalent impact fee. All of these facilities could experience a slight increase in use mainly due to the new residents’ proximity to these amenities; however, the City of Mountain View Parks and Recreation fee has already been paid for a 45-unit multifamily residential development on this Site. Furthermore, any development of this Site has the right to use the existing 11,550 square foot recreational amenity as well as the surface of the adjacent 0.5 acre SFWD R/W (see subsequent L.2 for details); therefore, there are no impacts to recreation resources.

L.2: The Property is entitled to use the adjacent private recreational facilities that were vested when the parcel was subdivided through a private financing agreement. The 11,550 square foot shared recreational area that includes a pool with patio seating for large social gatherings and a cabana with restrooms, kitchen facilities and a meeting room.

The development of the Site will also has surface rights to develop the adjacent 0.5 acre SFWD R/W into landscaping, a private recreational area, parking, or storage that is exclusive of structures.

Residents of the proposed development have lighted sidewalks and signalized intersections for safe access to all of the aforementioned recreational amenities.

Finding. No significant impacts to recreation resources are expected and no mitigation is required.

M. AESTHETICS

Will the proposed project result in the following environmental effects?	No Impact	Less Than Significant Impact	Less Than Significant With Mitigation	Potentially Significant Impact
1. Have a substantial adverse effect on a scenic vista?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Substantially degrade the existing visual character or quality of the site and its surroundings?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. Create a new source of substantial light or glare, which would adversely affect day or nighttime views in the area?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

M.1 & 2: The City of Mountain View’s CEQA Guidelines state that for a project to have significant visual impacts, it must either be located in an area that is considered to be an aesthetic resource or block views of an aesthetic resource. This Site is located in a heavily developed urbanized commercial/residential corridor that is not considered an aesthetic resource. Furthermore, California Street is recessed but Ortega Avenue provides a view corridor of the mountains which is partially blocked by trees on El Camino Real. The

proposed R4 zoning is in keeping with the original 1968 General Plan for this area which allowed the height necessary for high density residential development. The proposed R4 development on this Site is at a height of 4-stories or forty five feet to a maximum architectural feature height of sixty feet that will not block any views as the Domizile is of the same height next to the Sobrato office building which is even higher. Sixty feet is lower than the height of the Sobrato office buildings and the 11-story Avalon Towers that impede views of the mountains. The adjacent Hastings Square West condominiums do not have views of the Santa Cruz or Diablo Mountain Ranges due to their orientation and 3-Story height; hence, the height of the Domizile Condominiums and Sobrato office buildings obscure views of the mountains but some units on the north side do have views of the San Francisco Bay. However, it should be noted that had the second phase of the 45-unit multifamily development proceeded as scheduled these potential views would not exist today and are not considered an aesthetic resource.

M.3: The Development Review Committee (“DRC”) evaluates projects to assure that the design is in keeping with community standards for aesthetic and harmonious development. The DRC’s predecessor in interest SPARC reviewed and approved plans for the 45-unit multifamily development that have the same architectural design as the adjacent Hastings Square West Condominiums.

M.4: Any development will include exterior lighting at levels that would allow safe navigation of walkways but not create significant light or glare. Any new project will be a change from what exists today and the addition of new on-site lighting may impact the 3-story neighboring condominiums. Therefore, any exterior light fixtures shall be oriented and directed downward so as to protect neighboring residents from excess light and glare. This will be a required condition any final plans for construction.

Finding. With the mitigation measures recommended above there will be no impacts to aesthetic resources and good design will make exterior lighting less than significant.

N. CULTURAL RESOURCES

Will the proposed project result in the following environmental effects?	No Impact	Less Than Significant Impact	Less Than Significant With Mitigation	Potentially Significant Impact
1. Cause a substantial adverse change in the significance of a historical resource as defined in CEQA §15064.5?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Cause a substantial adverse change in the significance of an archaeological resource pursuant to CEQA §15064.5?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. Disturb any human remains, including those interred outside of formal cemeteries?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

N.1: According to a Cultural Resources Assessment prepared for the City’s 1992 General Plan, there are no known paleontological resources in the vicinity of the Site and there are no historic buildings on the Site.

N.2: There are no known archaeological resources in the immediate vicinity of the Site.

A formerly recorded archaeological site of importance, known as the Castro Mound, was located at the northeast corner of the intersection of San Antonio Road and Central Expressway that is approximately 2,000 feet from this Site. Stanford University archaeologists first excavated the Castro Mound in 1893 and recovered the remains of more than 150 Native Americans. The Castro Mound disappeared in the 1940s and the site and its surroundings subsequently developed.

Earthmoving activities have occurred on the Site throughout the years and no archaeological artifacts have been uncovered. In the event construction activities result in the discovery of archaeological artifacts, all activities within a 50-foot radius will be halted and a qualified archaeological monitor will inspect the Site within 24 hours. If the find is determined to be significant and merits formal recording or data collection, time and funding will be required to salvage the material. Any archaeologically important data recovered during monitoring will be cleaned, catalogued and analyzed, with the results presented in a report of finding that satisfies professional standards.

N.3: There are no known historical resources in the vicinity of the Site.²⁵

N.4: There are no known human remains on or in the vicinity of the Site. If human remains should be encountered during construction, work will be halted and procedures described in N.2 above will be implemented.

Finding. No impacts to cultural resources are expected and no mitigation is required.

O. MINERAL RESOURCES

Will the proposed project result in the following environmental effects?	No Impact	Less Than Significant Impact	Less Than Significant With Mitigation	Potentially Significant Impact
1. Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

O.1 & 2: According to the City of Mountain View 1992 General Plan, there are no significant mineral resources on this Site; therefore, there is no impact.

²⁵ Cultural Resources Assessment for the 1992 General Plan, Basin Research Associates, Inc., August 1990.

P. AGRICULTURAL RESOURCES

Will the proposed project result in the following environmental effects?	No Impact	Less Than Significant Mitigation	Less Than Significant With Impact	Potentially Significant Impact
--	-----------	----------------------------------	-----------------------------------	--------------------------------

In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Dept. of Conservation as an optional model to use in assessing impacts on agriculture and farmland. Would the project:

- | | | | | |
|--|-------------------------------------|--------------------------|--------------------------|--------------------------|
| 1. Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use? | <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| 2. Conflict with existing zoning for agricultural use, or a Williamson Act contract? | <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| 3. Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use? | <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |

P.1 2, & 3: At 2.01 acres the size of the Site is insufficient for an economically sustainable, commercial farm. The R4 proposed zoning will not conflict with the existing R3-3 zoning and there is no Williamson Act contract; therefore, there are no impacts.

VIII. MANDATORY FINDINGS

Will the proposed project result in the following environmental effects?	No Impact	Less Than Significant Impact	Less Than Significant With Mitigation	Potentially Significant Impact
--	-----------	------------------------------	---------------------------------------	--------------------------------

- | | | | | |
|---|-------------------------------------|-------------------------------------|--------------------------|--------------------------|
| 1. Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory | <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| 2. Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)? | <input type="checkbox"/> | <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |

3. Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?

IV. DETERMINATION

- I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared based on the aforementioned analysis and the original Environmental Impact Report prepared by Dr. Victor Riches of Riches Research, Inc., Mr. Nestor Barrett, former Santa Clara County Planning Director, Messrs. John Waters, David Powers, and Renato Martinez of Mission Engineers, Inc., and Mr. Karl Treffinger and Associates, Architects and Consultants on Design, dated May 1973.
- I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.
- I find that the proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect 1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and 2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.
- I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

September 25, 2009

[Revised letter September 28, 2010 because of recently discovered information concerning Resolution 8162, Series 1969, approving a 4-story 166-unit apartment development in 1969 on the property and the 1968 City of Mountain View General Plan that designates this property for "high-density, high-rise residential structures" as well for grammar, etc.]

Mr. Michael Martello
City Attorney
Mr. Randy Tsuda
Director of Community Development
City of Mountain View
500 Castro Street
Mountain View, CA 94039-7540

**RE: 2.01 ACRES @ 394 ORTEGA AVENUE
MOUNTAIN VIEW, CA 94040**

Dear Messrs. Martello and Tsuda:

As you know the partnership that owns the 1.6 acre property that includes the surface rights to 0.5 acres of the San Francisco Water Department Hetch-Hetchy Right-of-Way at 394 Ortega Avenue ("Property" or as referred to in past correspondence "Parcel B") is anxious to proceed with the development of its Property. The owners have requested under a prior letter to the City of Mountain View, addressed to Mr. Kevin Duggan, dated September 12, 2001, and most recently transmitted again on July 19, 2009, to Mr. Randy Tsuda ("Letter" Exhibit A), that presents the environmental planning arguments, at a minimum, for a reversal of an incorrect and legally impermissible reduction in density, and at best, for an R-4 zoning designation. This Letter focused on the environmental considerations for a higher density designation, and requested that the Property be considered for the 2002 Housing Element update, but was received too late for consideration at that time. This writing and analysis, and the aforementioned Letter, are being submitted for the 2010 Housing Element and General Plan revision to permit, at a minimum, the originally approved 45-unit apartment development under Resolution 9970 dated February 11, 1974 (Exhibit B), and hopefully for an R-4 zoning designation under the R-4 Zone Development Standards Multi-Family Housing as outlined in Article XII of Residential and Overlay Districts, for a higher density ~~for~~ market rate senior housing development.

STATED REASON FOR REDUCTION IN DENSITY DID NOT FIT THE NEIGHBORHOOD

Placing the R3-3* zoning on this Property and reducing the density through the creation of the 394 Ortega Avenue Precise Plan under Resolution 14413 dated April 22, 1986

(Exhibit C) voided the previously approved permit for an apartment development. Resolution 14413 passed by the narrowest of margins on a four-to-three vote because of the irrelevant reasoning stated simply as:

“During discussion of the Klein School zoning [the property located across Ortega Avenue from the subject Property], the Council initiated consideration of amendment of the Precise Plan for 394 Ortega [this is legally incorrect as there was no precise plan on the Property at that time] in order to consider a lower density in concert with that of Klein School site.”¹

The explanation for creating the 394 Ortega Avenue Precise Plan for a lower density and implementing an R3-3* zoning is not a legally valid reason, especially when the California/Ortega Precise Plan for the former Klein School site upon which the aforementioned explanation is based, states:

“The senior citizen housing component may be developed with a maximum of 50 dwelling units per acre.”²

This is in direct contraction to the explanation given for a rezoning of this Property, and furthermore, no environmental factors were stated in the initial environmental study supporting a lower density;³ hence, it is morally reprehensible, patently unfair, and discriminatory for this reduction in density to have occurred. Under the normal planning process the proposed development for the former Klein School property would have to conform to the surrounding neighborhood and in this particular instance a major portion of the development is out of context to the surrounding properties in order to “have a low-intensity ownership-like character,”⁴ which under today’s urban planning vernacular equates to “spot-zoning” because there were no single family ownership units surrounding the former Klein School site.

FACTS & ISSUES OF SUBSTANTIAL IMPORTANCE WERE OMITTED

By design or inadvertent omission of the nuances of the City Attorney’s opinion, project history, legally binding agreements, and payment of fees, the City Council and Environmental Planning Commission were not provided with all the facts and relevant information upon which to make a fully informed, legislative decision. The undersigned at the time did not have access to all the documents of today but stated “he did not feel equal treatment was being given to this parcel since such high densities had been permitted on the Harrington-Sobrato and Armax properties along El Camino Real”⁵ and across Ortega Avenue behind Klein Park, a 50-unit per acre Ginzton Terrace

¹ City of Mountain View Environmental Planning Commission Minutes dated March 19, 1986, agenda item 4.2 Proposed Precise Plan Adoption; 394 Ortega Avenue, p.1. pp.3.

² City of Mountain View, California/Ortega Precise Plan, January 28, 1986, p. 2, sec. B. (3) Senior Citizen Housing.

³ City of Mountain View, State of California, California Environmental Quality Act, Initial Study, Application No. 62-86-PPA, dated March 3, 1986.

⁴ City of Mountain View Environmental Planning Commission Staff Report, March 19, 1986, p. 1, sec. 4.2 Proposed Precise Plan –394 Ortega, pp. 2.

⁵ City of Mountain View Environmental Planning Commission Minutes dated March 19, 1986, agenda item 4.2 Proposed Precise Plan Adoption; 394 Ortega Avenue, p.6. pp.5.

development, and across California Street, two and three story apartments at R3-1 (which brings into question why an R3-3* zoning was instituted on this Property - no reasons are cited), and immediately adjacent to a three story 75-unit condominium development known as Hastings Square West, and behind the Property, a commercial retail development and its associated loading docks. In keeping with sound planning concepts this makes no sense for siting "low-intensity ownership-like character"⁴ homes, especially since the property sits at a major corner ~~arterial~~. (See aerial and view corridor photos on the following pages.)

Furthermore, "he did not believe that the decrease in density was legal in light of the previous planned community permit approval"⁶ because to the best of the undersigned's recollection at the time, no other property in the history of Mountain View had its density reduced under these circumstances, especially after having received approval for a development, which is borne out by recently obtained documents from the City of Mountain View. Of particular legal significance are the minutes to the 1974 Resolution 10101 which specifically states:

"Approving the recommendation of the Zoning Administrator that the request from Menlo Mortgage Investment Company [developer of Parcel A] be **approved for phasing** and design modifications relating to the approved PC Permit for **apartment development** at 394 Ortega Avenue, subject to the following conditions:

1. Applicant's request to proceed with construction on only 75-units on Parcel A at this time is hereby approved [which is consistent with a phased development agreement].
2. The conditions of approval of the tentative minor subdivision map and the Planned Community Permit **shall remain in full force and effect** [again consistent with phased development agreement]."
[Emphasis added.]

Of legal importance is no sunset provision is stated in the minutes or resolution, and it clearly states "apartment development" which is rental, not ownership housing. Of further significance are the words "approved for phasing" which are in the official minutes, yet never stated in the 1986 City Council or Environmental Planning Commission staff reports, and most likely this detail was kept from the City Attorney as well who nevertheless concludes:

"Having reviewed your staff report to the Environmental Planning Commission, I feel our discussion needs some clarification. The change of use of Parcel B cannot be undertaken without risk of being overturned."⁷

⁶ Ibid. p.6, pp. 5.

⁷ [Robert Logan, City of Mountain View Special Counsel, Inter-Office Memorandum to Ken Alsman, Principal Planner, dated March 11, 1986, p.1, pp. 1.](#)

EXHIBIT INDEX

<1 – Looking SW @ 3-Story Hastings Square West Condominiums

<2 – Looking SW @ 10-Story Avalon Towers Apartments

<3 – Looking West @ Target Store

<4 – Looking North @ 2- & 3-Story Apartment Complexes

<5 – Looking East @ Klein Park

<6 – Looking SW @ Site

<7 – Looking SW @ 3-Story Californian Apartments

<8 – Looking SW @ 4-Story Domicile Condos & 10-Story Avalon Towers

Please note there is no mention of Resolution 10101, minutes, or correspondence, supporting the phased approach for an apartment development, let alone the construction of all on- and off-site infrastructure and payment of fees for a 45-unit apartment development, which would further support the City Attorney's opinion that voiding an existing permit and reducing the density is not permissible. While the argument may be cast that the owner provided at least the information pertaining to the payment of fees during his three minute presentation, all of us are well aware that a legal opinion carries more weight in these matters and not all the information that is being presented now was capable of being presented then in three minutes; therefore, the owner, was at a significant disadvantage.

“...the owner of the [P]roperty...explained that over the years, the City has initiated several rezonings [the term being used loosely for the reduction in density from 166-units, four-stories, to 120-units, three-stories, through the SPAR development review process, the predecessor in protocol to the Design Review Committee] which have resulted in significantly lower density permitted on the property than would have been originally allowed. He further noted that he has a vested right in the 45 units allowed under the planned community permit since recreation fees have already been paid for that number of units.”⁸

All of us are aware of the soft-story apartments along California and Latham Streets that will eventually undergo seismic retrofit and most likely demolition in favor of four and five story developments. Of major noteworthiness is the existing ten story Avalon Towers mid block from the Property and the proposed ten story San Antonio Center apartments; therefore, SPAR's perspective was not in keeping with what has and will occur in this area.

LEGALLY IMPERMISSIBLE TO REDUCE DENSITY WITHOUT SUSTENTATIVE FINDINGS

The decrease in density was not initiated based on any environmental issues. In fact the City of Mountain View, State of California, California Environmental Quality Act, Notice of Determination, Application No.: 62-86-PPA, dated March 3, 1986, states the reduction in density is “Incompatible with zoning and plans” and it is now evident that the negative response to “The environmental effects of the project will cause substantial adverse effects on human beings, either directly or indirectly” is incorrect because there has been and continues to be a lack of housing.

The City Attorney's inter-office memorandum to the Principal Planner dated March 11, 1986, states:

“Having reviewed your staff report to the Environmental Planning Commission, I feel our discussion needs some clarification. ***The change of use of Parcel B cannot be undertaken without risk of being overturned.***”

⁸ Ibid. p.6, pp.6.

This office's conclusion that the [P]roperty might be rezoned was based on several caveats. The first related to the question of whether improvements and expenditures on the Parcel 'A' gave some vested rights to develop Parcel 'B' [makes no mention of the improvements and expenditures on Parcel B]. ***I do not think that issue is resolved based on the sketchy information we now have. The one year expiration of the permit is not cast nearly as clearly as your memo implies. In fact, I recall advising you that the one year provision we looked at did not support that conclusion.***

Any representations you make should be made with a clear understanding that the property owner may have rights to continue to develop at the present level of density. I don't want the Commission to be misled into thinking that the proposed change will occur without any legal ramifications." [Emphasis Added.]

Rather than provide the full context of the City Attorney's inter-office memorandum on the legality of rezoning, or the fact that the project was a previously approved phased development with all fees paid in full and off-site improvements for utilities and access constructed, the staff report merely and succinctly concluded that the "PC permit [Planned Community Development permit for a 45-unit apartment development] is now void..."⁹ This conclusion is not only incorrect but also misleading in that an implicit development agreement¹⁰ was in effect by virtual of the documents (memorandums, minutes, resolutions, easements, etc.) having been filed, recorded, and fees paid to preserve these rights, but in 1986 these facts were never disclosed to the City Council or Environmental Planning Commission and more than likely not even known to the City Attorney. The Principal Planner did more than just omit the City Attorney's opinion by only stating the "PC permit is now void and there is no precise plan for this P-zoned property. In effect, there are no adopted guidelines for use of the land."¹¹ The Principal Planner omitted the conditions for approval cited in Resolution 9970 and the elements of a development agreement by neglecting to cite not only the aforementioned minutes and memorandums but also:

1. Resolution 8162, Series 1969, approving a 4-story 166-unit apartment development that was consistent with the 1968 Mountain View General Plan that specified "high density, high-rise residential structures" for this property.¹²

⁹ City of Mountain View, Inter-Office Memorandum dated April 1, 1986 (at right bottom of "Council Agenda, April 22, 1986), p. 2, pp.1.

¹⁰ Development Agreements, Disposition & Development Agreements, etc. or any synonymous terms for an agreement between a private developer/owner and the City were, to the best of the undersigned knowledge, non-existent in the City of Mountain View at this time, and at best, only in their infancy for major developments.

¹¹ City of Mountain View, Inter-Office Memorandum dated April 1, 1986 (at right bottom of "Council Agenda, April 22, 1986), p. 2, pp.1.

¹² City of Mountain View General Plan 1968, p. 57, pp.3.

4.2. Mr. Byron F. Hovik's letter to the City of Mountain View dated June 18, 1974 (Exhibit E), clearly states this is a "phased development," wherein it states:
"During the many times we stood before the City Council and various departments of the City of Mountain View, **we attempted to clearly explain our plan to build the project at 394 Ortega Avenue in two phases.** The original minor subdivision request was submitted in 1969 and the final plan was processed by Sandis & Associates early this year [1974]. The concept from the beginning was for the condominiums designed for Parcel A to be built by the undersigned [Menlo Mortgage Investment Co.] immediately upon plan approval with the owners of Parcel B to follow thereafter in accordance with their time table."¹³ [**Emphasis added.**]

2.3. Recorded legal documents for construction of shared recreational facilities to be used by both developments consisting of a cabana that contains a conference / meeting room, kitchen, gender specific restrooms, and a pool that:
"By contractual arrangement, the owners of Parcel A [Hastings Square West] will be responsible for the cost and construction of these **mutually shared facilities. By contract, the owners of Parcel B have the right of use of the recreational facilities and all tenants or owners of the 120 unit project share the expense of maintenance and operation on a pro-rata basis. The presentation to the real estate commissioner spells out this joint use and describes the project as Phase A and Phase B. When Parcel B is completed, the right of use of the recreational facilities is secured.**"¹⁴ [**Emphasis added**]

3.4. Recorded an easement agreement for a driveway that runs the entire length from Latham Street to California Street, at the rear of Parcel A and Parcel B, making development of single family homes in effective, problematic, and an inefficient use of resources that should have been listed as a negative finding in the California Environmental Quality Act Initial Study.

"A common use easement has been established between the owners of Parcels A and B granting free access to the driveway. Because of the economic factors and the impracticability of continuing the driveway through Parcel B before construction actually begins on Parcel B, it is planned that the driveway will temporarily stop at the boundary between the parcels."¹⁵

See Exhibit F, Grant Deed (Perpetual Easements Appurtenant).

4.5. Under the terms of the purchase agreement by which the developers of Parcel A, Menlo Mortgage Investment Company, acquired their property, and due to the City of

¹³ Byron F. Hovik's letter of June 18, 1974 addressed to the City of Mountain View, p. 1, pp. 1.

¹⁴ Ibid., p.2, article 4.

¹⁵ Ibid., p.2, article 5.

Mountain View's request to have a fully improved street, the owners of the Property paid for not only the aforementioned shared recreational facilities but also for their share of the Ortega Avenue street improvements from Latham Street to California Street, that consisted of widening Ortega Avenue and installing sidewalk, curbs, and driveway entrances for developing a 45-unit apartment complex. The owners paid for their pro-rata share through a lower purchase price as it was financial duress which forced the sale of Parcel A to begin with and delayed development of the Property.

~~5-6.~~ All City of Mountain View Subdivision and Development fees for development of Parcel A, a 75-unit condominium development, and Parcel B, a 45-unit apartment development, were paid in full in 1974, by each respective owner (Exhibit G). These fees consisted of Sanitary Sewer Main Facility, Water Main Facility, Storm Drain Contribution, Map Checking Fee, Plan Check and Inspection Fee, and Recreation Fee.

~~6-7.~~ The owners of Parcel B paid for a PG&E underground transformer of the size and capacity for providing electrical service for a 45-unit apartment complex that is in place and operational as well as for a 3" water meter and 6" sewer lateral that are stubbed to the Property line.

In conclusion the rezoning and implementation of the 394 Ortega Avenue Precise Plan is morally and ethically reprehensible and legally impermissible because:

- The legislative decision making bodies were not provided full and complete details that were readily available and in the City of Mountain View's files, and arguably would have reversed the narrow passage of the four-to-three votes cast by both the City Council and Environmental Planning Commission.
- The subjective nature of the reason for the rezoning and Precise Plan mandated by the Mountain View City Council 1986 Resolution 14413 Series 1986.
- No environmental reasons are stated in the Notice of Determination and Initial Study for compliance with the California Environmental Quality Act for the rezoning and Precise Plan, and under today's dearth of housing are factually incorrect and still "Incompatible with zoning and plans"¹⁶ as clearly evident from the photos and because Klein Park separates this development from the Oak Tree Commons development.
- Full notice of the vested rights for the development of the Property and use of the shared recreational facility are stated in the Hastings Square West (which is the adjoining three story condominium development) HOA CC&Rs and grant deed.
- Resolution No. 10101 Series 1974, **A RESOLUTION APPROVING CHANGE IN CONSTRUCTION SCHEDULE UNDER PLANNED COMMUNITY PERMIT ON 394 ORTEGA** clearly states (as if the title was not clear enough) "the 45 units on

¹⁶ City of Mountain View, State of California, California Environmental Quality Act, Initial Study, Application No.: 62-86-PPA, sec. Environmental Effects B(8), dated March 3, 1986.

Parcel B to be developed at a later time” and the “recreation area, including pool and cabana, located on Parcel A is to serve both parcels.”¹⁷

- All on- and off-site infrastructure was constructed and installed for a 45-unit apartment.
- All fees were paid in June of 1974, and should be returned with interest if there is a finding that the Property has no vested rights for its proposed development; otherwise, they should remain and be credited against any future fees.
- The City of Mountain View has not followed the City Council guideline in reviewing all Precise Plans every five years for their validity and applicability.

Rather than deliberate on the aforementioned issues, it would best to move forward in a **positive light**. That **light** would be to have the City of Mountain View rectify this situation by incorporating this Property in the current revision of the Housing Element and General Plan for an R-4 zoning that would allow for a housing development that is economic, market driven and feasible, and not predicated on injecting the San Francisco Water Department Hetch-Hetchy Right-of-Way in the density formula but only for providing open, landscaped space, limited parking and setback for the development on the owners' fee interest.

Sincerely,

MATT PEAR

RE: 394 ORTEGA AVENUE DENSITY

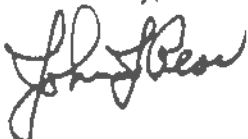

Dear Mr. Duggan:

It is my understanding that the City of Mountain View is currently revising the Housing Element to the General Plan, and among other items, is identifying parcels suitable for high-density residential development. At a minimum, please reinstate the original density for 394 Ortega Avenue, but more importantly please revise the 394 Ortega Avenue Precise Plan to allow 50 dwelling units per acre ("DUA") in order to accommodate a four-story corporate and/or senior assisted housing development. The attached *Request For Reinstatement Of Original/Preferably Higher Density 394 Ortega Avenue, Mountain View CA* provides the details for this request.

In the 1960s, I informally submitted plans for a 166-unit apartment complex on the property along the west side of Ortega Avenue, reaching from Latham to California Street, adjacent to what is now known as Target Store. Due to a number of factors, the project was postponed and eventually scaled back to 120 units. Financial difficulties forced the phased development of this site which resulted in the sale of parcel A in 1974 for 75 condominiums and the delay in constructing the remaining 45 apartment homes on parcel B now known as 394 Ortega Avenue. The infrastructure is in place for a high-density mid-rise development, i.e. all utilities with adequate capacity are stubbed to the property with no further street cuts required and recreational amenities are available next door and across the street.

In April of 1986, parcel B was again down zoned for no specific environmental reason and contrary to the City of Mountain View attorney's advice that "The change of use of Parcel B cannot be undertaken without risk of being overturned... the property owner may have rights to continue to develop at the present level of density,"¹ because a significant portion of the approved development and infrastructure was already in place. The low-density designation has frustrated the development of this site due to the ramifications of locating owner occupied housing adjacent to Target Store's loading docks. As you may recall, these loading docks were the subject of the Hastings Square West Homeowners Association ("HSHOA") litigation threat from 1987 to 1994, and continue to be a source for complaints even though the loading operations existed prior to HSHOA. The Silicon Valley Manufacturing Group and Greenbelt Alliance publication list this site for high-density residential development, presumably because it's close to mass transit (e.g. CalTrain), recreational amenities services, etc. Please process this request for 50 DUA as you revise the Housing Element to the General Plan, which will also help meet ABAG's housing allocation. Thank you.

Yours truly,

¹ Inter-Office Memorandum from Robert Logan, Special Counsel to Ken Alisman, Principal Planner, dated March 11, 1986.

**REQUEST FOR REINSTATEMENT OF ORIGINAL/PREFERABLY HIGHER DENSITY
394 ORTEGA AVENUE, MOUNTAIN VIEW CA**

EXECUTIVE SUMMARY

As the City of Mountain View revises the Housing Element within the General Plan and reviews parcels for higher density rezoning or precise plan modifications, the owners of the southwest corner of 394 Ortega Avenue at California Street ("Property" or "Parcel B" as illustrated on Exhibit A) respectfully request, at a minimum, reinstating the 28 dwelling units per acre ("DUA") density that allowed for the previously approved 45-unit multifamily apartment complex. However, the owners prefer a density of up to 50 DUA in order to allow a four-story corporate/senior housing project, which on a per unit basis takes less space than an apartment unit and as such the bulk/massing will appear less than a similar number of apartment units.

In today's economic and demographic climate it only makes sense to allow a higher density on Parcel B. The Property is well situated in that

- It is surrounded by two and three story multifamily complexes to the north and south or on the sides, a mini-park to the east or in front, and a regional shopping center in back making the siting of either an entrepreneurial work force or senior citizens housing advantageous due to the proximity of transportation, employment, services, and recreational amenities.
- An eleven-story residential complex known as Avalon Towers at 100 DUA is under construction that is less than one block away, and a proposed conversion of the Comstock Apartments (across the corner from the Property in the 2200 block of California Street) is being contemplated.
- It is directly across the street from Klein Park (a mini-park) and approximately 2-100 feet away from Rengstorff Park and the Mountain View Community Center (a community park) and the Mountain View Senior Center.
- It has the rights to use the adjacent private recreation amenities which includes a pool and cabana complete with conference room, kitchen, and restroom facilities.
- It is surrounded by an excellent roadway system that is fully improved with pedestrian and bicycle facilities.
- It is within easy walking distance of two major transportation nodes: the San Antonio CalTrain Station and the Santa Clara Valley Transportation Authority (VTA) bus service on California Street and El Camino Real as well as within a thousand feet of the San Antonio Transit Center on Showers Drive.
- The requested density should not have a significant adverse impact on the Level of Service for local streets and intersections according to a review of three independent transportation impact analyses recently performed for other projects in the immediate area.
- All utility infrastructure and street improvements for serving a 45-unit multifamily development are in-place and stubbed to the Property line.

**REQUEST FOR REINSTATEMENT OF ORIGINAL/PREFERABLY HIGHER DENSITY
394 ORTEGA AVENUE, MOUNTAIN VIEW CA**

- There were never any (and still are no) objective, quantifiable environmental factors for the reduction in density that occurred in 1986 and such a lower density will only result in future single family homeowners filing complaints with the City of Mountain View over Target Store's adjacent loading dock practices, outdoor lighting, etc , and
- Development of the Property at 50 DUA will go toward meeting the City of Mountain View's ABAG Regional Housing Allocation of 3,420 dwelling units

The owners respectfully request, that at a minimum the original density be reinstated, preferably up to 50 DUA in order to allow a four-story corporate/senior housing development on Parcel B, which consists of 2.01 acres that includes the 0.4 acre San Francisco Water Department Hetch-Hetchy right of way for which the owners retain surface rights. The aforementioned development would require less amenities and infrastructure than a 45-unit apartment but would be of a similar quality, density, and massing as Park Place on Castro Street or the Park Crossings Condominiums on Showers Drive. Due to financing, construction and operational economies of scale a minimum of eighty-five units is required for senior assisted housing.

COMMUNITY PERSPECTIVE

As stated in the Silicon Valley Manufacturing Group's and Greenbelt Alliance's publication *Building Sustainable Communities, Housing Solutions for Silicon Valley*

"The two most important ways to enhance land use efficiency are to increase the number of homes being built per acre and to identify more opportunities for reusing underutilized land. Underutilized land is a critical resource because it is typically developed with more homes per acre than vacant land and because this land can be reused without compromising the region's open space and existing urban growth boundaries. Increased housing supply is clearly a necessity for maintaining this region's ability to find a sustainable balance between economic vitality and livable communities."¹

Placing density where it is well supported by the appropriate infrastructure makes good sense from an economic and environmental perspective. This Property has the appropriate recreation, transportation, and utility infrastructure to support 50 DUA.

RECREATIONAL AMENITIES

The Property is well serviced with a full array of recreational amenities and is located within the City of Mountain View's Parks and Open Space Plan's San Antonio Planning Area.

"The San Antonio Planning Area includes some office buildings and extensive commercial areas, including a large shopping district. About half of the area is residentially zoned. The residential areas are heavily

¹ *Building Sustainable Communities: Housing Solutions for Silicon Valley*, prepared for Silicon Valley Manufacturing Group and Greenbelt Alliance by Strategic Economics, November 1999, p. 13, pp. 1 & 4.

**REQUEST FOR REINSTATEMENT OF ORIGINAL/PREFERABLY HIGHER DENSITY
394 ORTEGA AVENUE, MOUNTAIN VIEW CA**

multi-family with only small pockets of single family homes. The percentage of land in open space use is above the average for all planning areas. However, multi-family units are the primary type of residence, with several buildings multiple stories in height. As a result the density of the residential areas is high compared to the [City] average.”²

Since Parcel B was part of a larger, phased development, on-site recreational amenities are in place and available for use. Any development on the Property will be entitled to use the adjacent swimming pool including a cabana complete with kitchen facilities, conference room, and restrooms.

Across the street from the Property is Klein Park, a 1.25 acre mini-park that offers a playground for the toddlers, a basketball court for the athletic, walkways for the young at heart, a picnic area for those who prefer to eat, and a pleasant passive area for those who prefer to reflect.

Approximately 2,100 feet away is Rengstorff Park, a 27.3 acre community park that is home to the City's Community and Senior Centers and Community Garden as well as a full assortment of amenities and structured adult and children activities, including but not limited to: an auditorium with meeting rooms, barbecue facilities and picnic area, baseball, softball, and soccer fields, children's play equipment, swimming pool, basketball, tennis, and volleyball courts, and public restrooms.

EXCELLENT TRANSPORTATION SYSTEM

Excellent regional and local access is provided through mass transit and an improved roadway network complete with sidewalks on both sides of all surrounding streets and crosswalks at signalized intersections for pedestrian and bicycle access.³ Effective access to transit services is provided by pedestrian paths and/or sidewalks.

Excellent regional access is provided to the Property by

- US Highway 101 (an eight-lane freeway accessed via the interchanges at San Antonio Road and Rengstorff Avenue) and State Route 85 (a six-lane freeway comprised of two mixed flow and one HOV in each lane direction accessed via the El Camino Real and Central Expressway),
- The Santa Clara Valley Transportation Authority (VTA) bus service which runs along both California Street and El Camino Real and at their San Antonio Transit Center on Showers Drive, which is one block away, and

³ Skyview Apartments Transportation Impact Analysis by Meyer, Mohaddes Associates, Inc., June 30 1998, Precise Plan For San Antonio Circle by Korve Engineering, Inc., March 31, 1999, and Ryland Homes Transportation Impact Analysis by Fehr & Peers Associates, Inc., February 2000 were consulted and relied upon for facts and the truth of the matter therein.

**REQUEST FOR REINSTATEMENT OF ORIGINAL/PREFERABLY HIGHER DENSITY
394 ORTEGA AVENUE, MOUNTAIN VIEW CA**

- The Peninsula Corridor Joint Powers Board (JPB) Peninsula Commute Service (CalTrain) San Antonio Station which is approximately 2,400 feet to the north.

Excellent local access is provided to the Property by the interconnection of the following surrounding surface transportation network: Central Expressway (a four-lane east-west expressway), El Camino Real (a six-lane east-west arterial), San Antonio Road (a six-lane north-south arterial) Rengstorff Avenue (a four-lane north-south roadway), Showers Drive (a four-lane north-south roadway), California Street (a four-lane east-west roadway that runs along the Property) and Ortega Avenue (a two-lane north-south street that fronts the Property) (Exhibit A)

Pedestrian Facilities are comprised of sidewalks, crosswalks, and pedestrian signals. All of the streets in the project area have sidewalks on both sides of the street. Crosswalks are provided at all signalized intersections, with pedestrian push buttons provided on each corner of signalized intersections.

Bicycle facilities are comprised of bike paths which are paved trails that are separated from roadways defined as Class I, bike lanes are lanes on roadways designated for use by bicycles by striping, pavement legends, and signs defined as Class II, and bike routes are roadways that are designated for bicycle use by signs defined as Class III. There is Class II bike lanes on California Street, Showers Drive, Central Expressway, and Rengstorff Avenue. There is a Class III bike route on Latham Street and west of San Antonio Road that connects the California Street bike lanes to a bicycle/pedestrian bridge to Palo Alto (California to Del Medio to Miller Avenue) ⁴

TRIP GENERATION FORECAST

Three transportation impact analyses prepared for separate projects in the immediate vicinity of the Property all state that the impact from their specific project, in general as paraphrased in Ryland Homes Transportation Impact Analysis, "would not have a significant adverse impact at any of the study intersections" ⁵. This unanimous conclusion is based on maintaining the City of Mountain View's minimum acceptable Level of Service (LOS) at D (which is a more stringent standard), with LOS E being acceptable for intersections located in and around the San Antonio Center area (e.g., Showers Drive and California Street) ⁶.

Please note that all three traffic analyses assumed there would be at least twenty-five additional dwelling units at Avalon Towers (formerly Skyview Apartments), which is being constructed at a lower density than what was used in the analyses, and Korve Engineering's Precise Plan For San Antonio Circle assumed development of site C-2.

⁴ Precise Plan For San Antonio Circle by Korve Engineering, Inc., March 31, 1999, p 10, pp 4

⁵ Ryland Homes Transportation Impact Analysis February 2000 by Fehr & Peers Associates, Inc. p v, pp 1

⁶ Level of Service range from A which is operations with very low delay occurring with favorable progression and/or short cycle lengths to F which is operations with delays unacceptable to most drivers occurring due to over-saturation, poor progression, or very long cycle lengths

**REQUEST FOR REINSTATEMENT OF ORIGINAL/PREFERABLY HIGHER DENSITY
394 ORTEGA AVENUE, MOUNTAIN VIEW CA**

Furthermore, the Meyer Mohaddes Associates Inc analysis assumed "Two percent per year 'background growth' in traffic demand (due to intensification of non-specific land uses) "⁷ Therefore additional capacity exists in the LOS forecasts and overall transportation impact analyses' conclusions. Since all the transportation impact analyses show, at worst, a LOS of C/C+ for the Showers Drive/California Street intersection (whose standard is LOS E) to LOS A/B+ for Ortega Avenue/California Street intersection, there should not be any significant reduction in the LOS for surrounding streets and intersections at the higher proposed corporate/senior housing density.

ORIGINAL APPROVED DEVELOPMENT

The questionable reduction in density that occurred in 1986 diminished the usability of the Property, which is the reason it now sits idle. Originally the Property was approved for a 45-unit multiple-family complex which was the second phase of a much larger development, but implementation of the 394 Ortega Avenue Precise Plan lowered the density to at most 28 single-family dwelling units (more likely only 15 single family homes can actually be constructed due to various constraints). Such a reduction has frustrated the development of this Property in order to avoid unnecessary problems with the adjacent property operated by Target due to the problems inherent in having single-family homes in proximity to loading docks.

In the 1960s a site plan was developed for two 83-unit complex (166 units reaching from Latham to California Street along the west side of Ortega Avenue, covering what became Parcels A & B), however given the extreme development risk at the time, this project was shelved for consideration at a later date.

In November of 1973, the Council approved a Planned Community Permit for the construction of a 120-unit multiple-family residential development in the P (Planned Community) District. A minor subdivision to create two Parcels (Parcels A & B) was approved in June of 1974 (Exhibits A & C). The approved plan showed three 3-story buildings with subterranean parking for a total of 241 parking spaces (146 under, 95 open). Two buildings occupied the southerly half of the site known as Parcel A that included 75 condominium units with the remaining northerly Parcel B approved for a 45-unit apartment complex to be constructed along the San Francisco Water Department Hetch-Hetchy Right-of-Way closest to California Street. Only Parcel A was developed into a 75-unit condominium project known as Hastings Square West with Parcel B, the remaining 45-unit apartment complex, to be developed at a later date as stated in Resolution No. 10101 (Exhibit C). Due to financial constraints, Parcel A was sold and the second phase was not completed because the lower density caused the lender to withdraw financing. However, the infrastructure was installed to the property line, all fees were paid in full, and recreational amenities were constructed for the use by both Parcels A & B at the adjacent Hastings Square condominiums.

⁷ Skyview Apartments Transportation Impact Analysis by Meyer Mohaddes Associates, Inc., June 30, 1999, p.28, pp. 1.

**REQUEST FOR REINSTATEMENT OF ORIGINAL/PREFERABLY HIGHER DENSITY
394 ORTEGA AVENUE, MOUNTAIN VIEW CA**

On February 25, 1974 City fees (Sanitary Sewer Main Facility, Water Main Facility, Storm Drain Contribution, Map Checking Plan Check & Inspection, and Park and Recreation Fees) for development of Parcels A & B were calculated and paid in full in June of 1974 as evidenced by Exhibit B. Subsequently additional payments were made for improving the west side of Ortega Avenue with street pavement and sidewalk and the installation of an electric transformer vault, 3" water meter, and sewer nib for construction of 45-units on Parcel B.

In June of 1974, the developer for Parcel A petitioned and received approval to immediately construct 75 condominium units with 100 covered and 52 open parking spaces with the express understanding that the remaining 45 units on Parcel B would be constructed at a later date. On June 24, 1974 the City Council passed Resolution No. 10101, Series 1974, **A Resolution Approving Change In Construction Schedule Under Planned Community Permit On 394 Ortega (Exhibit C)**, which states

"Approving the recommendation of the Zoning Administrator that the request from Menlo Mortgage Investment Company [developer of Parcel A] be **approved for phasing** and design modifications relating to the approved PC Permit for apartment development at 394 Ortega Avenue, subject to the following conditions " [Resolution No. 10101, 6/24/74 Minutes]

- 1 **"Applicant's request to proceed with construction on only 75-units on Parcel A at this time is hereby approved**
- 2 **The conditions of approval of the tentative minor subdivision map and the Planned Community Permit shall remain in full force and effect.**
- 4 **The legal arrangement for joint use of the recreational facilities shall be subject to approval by the City Attorney "** [Emphasis Added]

APPROXIMATELY TEN YEARS LATER – REDUCTION IN DENSITY

On November 19th of 1985, unbeknown to the owners and for no apparent reason other than the City Council was reviewing the former Klein School site, two City Council members initiated Resolution No. 14282. The Resolution called for a reduction in density on Parcel B to 14.4 DUA for no apparent reason other than for "consistency" – it passed by a narrow margin of 4 to 3. A portion of the Oak Tree Commons development has this density with Ginzton Terrace at 50 DUA, which is behind Klein Park across Ortega Avenue from the Property. The surrounding properties are of a higher residential density and directly behind the Property is Target Store part of the San Antonio Regional Shopping Center, hence, the so-called "consistency argument" is incongruous with the surrounding density and use. The owners seek to re-establish their "vested right" to construct at least a 45-unit multifamily apartment complex. However, the current request is for a four-story corporate/senior housing project at a density that makes this type of project financially feasible, i.e., up to a 100-unit assisted care facility or corporate rental complex. It is important to note that **NO SPECIFIC**

**REQUEST FOR REINSTATEMENT OF ORIGINAL/PREFERABLY HIGHER DENSITY
394 ORTEGA AVENUE, MOUNTAIN VIEW CA**

environmental impacts or any other reasons were cited in support of the lowering of the zoning density in 1985. The only argument made in support of lowering the zoning density was for "consistency." The consistency argument is not accurate, as noted above. Beyond the consistency argument, the only known reason for the density change is because the Secretary for the Environmental Planning Commission said, "that the Planning Commission needs to establish development guidelines for the property."⁸ The details leading up to the rezoning of the Property are summarized in the City of Mountain View, Inter-Office Memorandum from the Environmental Planning Commission Staff to the City Council, dated April 1, 1986 (Exhibit D), which omits key legal and permit processing facts of having paid City fees and constructing the utility infrastructure, street improvements, and recreation amenities as part of a phased development. Accurate presentation of these facts would have allowed the council to make an informed decision and would most likely tip the scales in favor of leaving the then existing density unchanged.

The owners' objected to the lower density because single family development would interfere with their tenant's (Target Store's) adjacent retail operations, especially the loading docks in terms of complaints filed by homeowners, and it would force them to sell the Property for single-family lots, hence, single family development would be a constant source for future problems and litigation relating to the adjacent retail operations. There is a vast difference between having tenants versus homeowners adjacent to retail operations – tenants can move, homeowners litigate. Countless hours of both private and public resources were expended from 1987 through 1994 due to complaints filed by the Hastings Square West Homeowners Association concerning Target's retail operations. These complaints eventually resulted in the removal of eucalyptus trees and the construction of a masonry sound wall between Target Store and the Hastings Square Condominiums. Even though the retail loading docks were in operation with early morning deliveries a full seven years before the first Hastings Square West resident ever moved into the complex (the retail operations commenced in 1967 and Hastings Square West was constructed in 1974), the residents nevertheless mounted a campaign in 1987 to close the retail operation for the following reasons:

"Francis Smith, 400-B Ortega Avenue, No. 218, Mountain View, said that she represents the board of directors at the condominiums that are in back of this site [Target Store]. Ms. Smith said that she has lived in her condo for eight years and stated that the last six months since Gemco [prior tenant in interest to Target Store] has moved out have been the most peaceful ever. Ms. Smith said that the condominiums are mostly owner-occupied and that they have a strong pride in their building. Ms. Smith said that the main concern is the noise created by the store. She said that she is glad to see the sound wall being put up in the back, but she is still concerned about the noise from the loading dock since only 50'

⁸ Environmental Planning Commission Minutes, March 19, 1986, sec. 4.2, pp. 7.

**REQUEST FOR REINSTATEMENT OF ORIGINAL/PREFERABLY HIGHER DENSITY
394 ORTEGA AVENUE, MOUNTAIN VIEW CA**

separate the dock from her bedroom. She asked if the dock could possibly be relocated. She noted that diesel fuel from idling trucks covers their plants. Ms. Smith said that additionally, she can hear and see the fan on top of the building, which runs constantly. She said that the back parking lot has primarily been used most recently as a lovers' rendezvous and for drug deals. Ms. Smith said that she would also like to see the cleaning of the parking lot done at a different time. She said that the arc lights that light the parking lot are on 24 hours a day. She said that the condominium owners want to be good neighbors, but that the board of directors at the condo had threatened a class action suit with Gemco just to get some cooperation.

Eleanor Payne, 400-B Ortega Avenue, No. 110 Mountain View, said that the delivery trucks come at all hours of the day and evening.⁹

These complaints illustrate how the best of intentions for accommodating mixed-use can turn into a litigation nightmare due to the actions of a few ardent property owners. These residents, after full disclosure of the pertinent facts, purchased their condominiums adjacent to loading docks and the ambient sounds and sights it produces, yet sought to increase the value of their own unit by remedying the situation at someone else's expense. By reinstating the prior density these adjacent use problems can be mitigated. Simply stated, if a rental tenant is unhappy with the neighborhood, (s)he can move, which is economically impracticable for someone who has purchased a condominium. Through common ownership and control of both parcels, responsible owners can mitigate adjacency problems and develop much-needed dwelling units in furtherance of meeting ABAG Regional Housing Allocations.

ANALYSIS FOR RETAINING ORIGINAL DENSITY

At the City Council meeting, important facts and legal reasons for why this reduction in density should not occur were not presented since the owners were not represented by counsel and did not have access to the City Attorney's own legal analysis (Exhibit E). The reduction in density is essentially a rezoning and was clearly inappropriate and incorrect based on the following facts:

- Resolution No. 10101 (Exhibit C) which allowed for the original project to be developed in phases did not contain a sunset provision and further states that "the 45 units on Parcel B to be developed at a later time." This constitutes a vested right, which should not have been eliminated since there was no notification to the owners at any time that a construction delay for the remaining rental units on Parcel B might result in forfeiture of these development rights.
- Construction of over two-thirds of the approved development (and payment of all city fees, etc. for the entire project) vested development rights for the second phase.

⁹ City of Mountain View Zoning Administrator Minutes, June 16, 1987, sec. 2.7, p. 2, pp. 3.

**REQUEST FOR REINSTATEMENT OF ORIGINAL/PREFERABLY HIGHER DENSITY
394 ORTEGA AVENUE, MOUNTAIN VIEW CA**

- All fees (Sanitary Sewer Main Facility, Water Main Facility, Storm Drain Contribution, Map Checking Plan Check & Inspection, and Recreation Fees) for development of Parcels A and B were paid in full (Exhibit B). Furthermore, as stated in Mr. Byron F. Hovik's letter to the owners of June 10, 1974 (Exhibit F), the owners were compelled to pay all fees and agree "to the use of city sewer and water hookups."
- Utility infrastructure improvements for serving a 45-unit multifamily development on Parcel B were paid in full and constructed (i.e. stubbed to the Property line). The discounted sales price for Parcel A reflected Parcel B owners' contribution for street improvements (pavement and sidewalk) and the installation of an electric vault transform, 3" water main and meter, and sewer connection for servicing a 45-unit multifamily, residential building on Parcel B and the current recreational facilities (cabana and swimming pool) that are to be shared by Parcels A and B.

The Secretary to the Environmental Planning Commission stated during the meeting that:

"the City Attorney has reviewed this concern and has found that the planned community permit previously approved is no longer in effect. It is standard procedure in the City that a planned community permit is no longer in effect if no building permits have been requested in a 12-month period following the approval."¹⁰

The Secretary at both the Environmental Planning Commission meeting and the City Counsel meeting never mentioned the aforementioned issues/reasons of why this density reduction was inappropriate but instead only focused on whether a building permit had been issued for the remaining phase (which in a certain sense is still yes because the utility infrastructure was completed and the shared recreational amenities constructed). It is both interesting and alarming to note that even the City of Mountain View Special Counsel disagreed with the Secretary's position; yet the Secretary never mentioned this at the time to either the Environmental Planning Commission or the City Counsel.¹¹ An Inter-Office Memorandum from Robert Logan, Special Counsel, to Ken Alzman, Secretary to the Environmental Planning Commission, dated March 11, 1986 (Exhibit E), states:

"Having reviewed your [Secretary's] staff report to the Environmental Planning Commission, I feel our discussion needs some clarification. **The change of use of Parcel B cannot be undertaken without risk of being overturned**

¹⁰ Environmental Planning Commission Minutes, March 19, 1986, sec. 4.2, pp. 6

¹¹ Only recently was this information revealed based on an analyst's cursory review of the City of Mountain View files.

**REQUEST FOR REINSTATEMENT OF ORIGINAL/PREFERABLY HIGHER DENSITY
394 ORTEGA AVENUE, MOUNTAIN VIEW CA**

This office's conclusion that the property might be rezoned was based on several caveats. **The first related to the question of whether improvements and expenditures on Parcel 'A' gave some vested rights to develop Parcel 'B'. I do not think that issue is resolved based on the sketchy information we now have. The one year expiration of the permit is not cast nearly as clearly as your memo implies. In fact, I recall advising you that the one year provision we looked at did not support that conclusion**

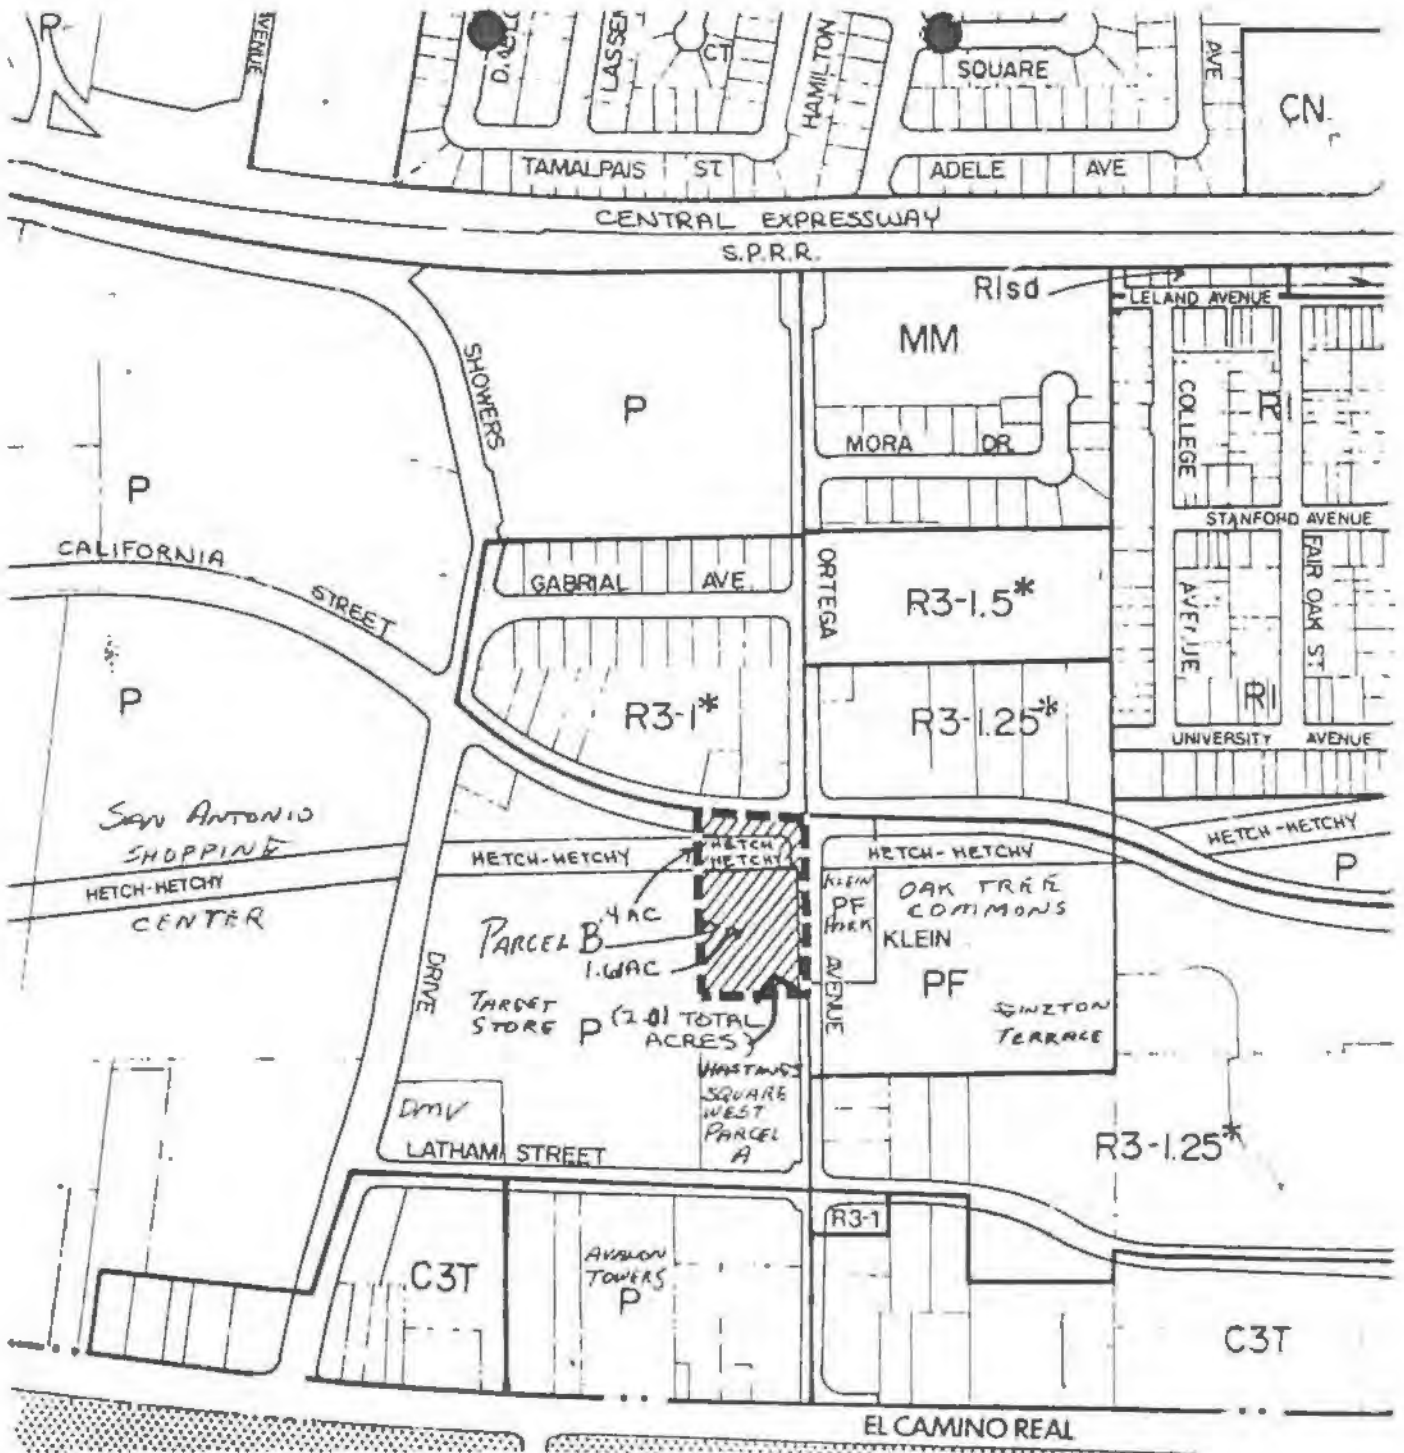

Any representations you make should be made with a clear understanding that the property owner may have rights to continue to develop at the present level of density. I don't want the Commission to be misled into thinking that the proposed change will occur without any legal ramifications." [Emphasis Added]

Based on the City of Mountain View's own legal analysis the owners have a vested right to develop at least a 45-unit project because they commenced the second phase through their contribution for street improvements, construction of recreational amenities and utility infrastructure, and because of the specific wording in Resolution No 10101 (Exhibit C) which approved a "change in construction schedule" but did not contain a sunset provision

CONCLUSION

Significant and important legal and permit processing information was never presented to the Environmental Planning Commission or City Council when Parcel B was rezoned for lower density, and in one instance that information was purposefully concealed from community decision makers. The end result is that a questionable reduction in density occurred by the narrowest of margins (by a vote of 4 to 3). This has not only resulted in a substantial diminution in usability for the subject site but has also resulted in losses for the community in terms of the overall economic multiplier effect through lost retail sales and housing. Development of the Property at the requested density will also go toward meeting the ABAG Regional Housing Allocation of 3,420 units for Mountain View and for siting an entrepreneurial work force close to its employment base and services. The Property has the prerequisite transportation and recreation infrastructure to support the previously approved higher density. It is the owners' intent to remain in this community by continuing to own this Property and to develop a first class project in all respects, but only under a development proposal based on sound economics and not under one in which they will have to literally "sell the family farm" and incur future liability due to the ramifications of siting single family homes adjacent to loading docks. The owners do not want problems and the best way to avoid them is to control both parcels and to build a first class development in which residents have the option to move should they find it difficult to live in a mixed-use development

RESOLUTION NO. 10101
Series 1974

A RESOLUTION APPROVING CHANGE IN CONSTRUCTION
SCHEDULE UNDER PLANNED COMMUNITY PERMIT ON
394 ORTEGA

WHEREAS, on February 11, 1974, the City Council of the City of Mountain View granted a Planned Community Permit to allow construction of a 120-unit multiple family residential development on the west side of Ortega, reaching from Lathan to California Street, in the P (Planned Community) District, said property being known as 394 Ortega Avenue; and

WHEREAS, the developer is processing a minor subdivision map to divide the property into two parcels of land, being Parcel A and Parcel B; and

WHEREAS, the developer has now requested, by letter dated June 18, 1974, permission to develop only the 75 units on Parcel A, with the 45 units on Parcel B to be developed at a later time; and

WHEREAS, a recreation area, including pool and cabana, located on Parcel A is to serve both parcels; and

WHEREAS, the Council has received and considered the report of the Zoning Administrator dated June 19, 1974.

NOW, THEREFORE, BE IT RESOLVED by the City Council of the City of Mountain View as follows:

1. Applicant's request to proceed with construction of only 75 units on Parcel A at this time is hereby approved.
2. The conditions of approval of the tentative minor subdivision map and the Planned Community Permit shall remain in full force and effect.
3. Applicant shall install a temporary on-site fire protection system acceptable to the Fire Chief, and shall make provision for automobile turn-around on Parcel A in a manner acceptable to the Zoning Administrator.
4. The legal arrangement for joint use of the recreational facilities shall be subject to approval by the City Attorney.

The foregoing Resolution was regularly introduced and adopted at an Adjourned Regular Meeting of the City Council of the City of Mountain View, duly held on the 24th day of June, 1974, by the following vote:

AYES: Councilmembers Allen, Anderson, Jelavich, Perez
and Vice-Mayor Moss

CITY OF MOUNTAIN VIEW INTER-OFFICE MEMORANDUM

DATE: April 1, 1986
TO: City Council
FROM: Environmental Planning Commission
SUBJECT: PROPOSED PRECISE PLAN, 394 ORTEGA AVENUE

Recommendation (Resolution)

That the City Council adopt the proposed precise plan for 394 Ortega Avenue (Exhibit II) and certify the attached Negative Declaration (Attachment B).

Background

In January 1986, the Council rezoned the Klein School site from the PF (Public Facilities) District to the P (Planned Community) District and adopted the California/Ortega Precise Plan to guide its future development. After extensive discussion of the density on the Klein School site, by both the EPC and Council, the Council acted to reference the R3-3* District (14.4 dwelling units per acre) as the base district for the Klein School site. The Council also included a provision for senior housing on two to three acres at a density of up to 50 units per acre.

Following the January discussion of the Klein School site, Council initiated consideration of the plan for the subject property, 394 Ortega Avenue (Attachment C). This land is zoned P but has no precise plan. The property is vacant except for an older single-family residence, accessory farm structures and several trees. The 2-acre area consists of 1.6± acres of privately owned land and a .4±-acre parcel which is part of the Hetch-Hetchy right-of-way. The property to the west is zoned P and developed with the Gemco store. The land to the north across California Street, although zoned for higher density R3-1* and R3-1.25* uses is developed with a mixture of apartments, duplexes and lower-density (9.5 units per acre) townhouses. The land on the east side of Ortega Avenue (the former Klein School site) was recently zoned to the P District with a basic density of 14.4± units per acre.

COUNCIL AGENDA
April 22, 1986

The subject property was originally included in a 1974 Planned Community permit for a 120-unit development on the entire block frontage between California and Latham Streets. Shortly after Council approval of that PC permit, the developers requested and were granted an amendment to the permit, excluding the subject property and allowing 75 units of the originally approved 120 units to be constructed on the adjacent parcel to the south. Site plans for these developments and appropriate Council resolutions are attached as Attachment D. At that time, 45 units could have been built on the subject land, at a density of 22.5 units per gross acre, including the Hetch-Hetchy right-of-way, or approximately 28 units per net acre of privately held land. That PC permit is now void and there is no precise plan for this P-zoned property. In effect, there are no adopted guidelines for use of the land.

Minutes and the staff report for the Planning Commission meeting as well as a Negative Declaration are attached for Council review and action (Attachment A).

Analysis

The decision on the Klein School density relied heavily on the General Plan policy for neighborhood diversity. Overall, the Council found that the neighborhood would be better balanced by providing more opportunities for lower-density ownership and townhouse developments. In order to relate the zoning on this property to that recently approved on the Klein School site, staff also recommended consideration of the R3-3* density, approximately 14½ units per acre, the privately owned property. The Planning Commission concurred with that recommendation.

The Hetch-Hetchy right-of-way has a substantial impact on the effective density and ultimate design of the land. The original 1974 approval included landscaping of the Hetch-Hetchy right-of-way as part of that full block development. Proper design of both of the developments and this portion of the community can be best served by fully incorporating the Hetch-Hetchy right-of-way, utilizing that land for landscaped open space and, potentially, access and parking.

In the case of the Klein School site, the Hetch-Hetchy right-of-way occupied approximately 11 percent of the overall acreage. The precise plan allowed full use of the acreage to calculate the density for the overall site. In this case, the Hetch-Hetchy right-of-way occupies approximately 21 percent of the P zoned area. Although the right-of-way cannot be used for building construction, it can be effectively used for landscaping and

parking. A sufficient incentive to ensure that it is included as part of the development is recommended by the Planning Commission.

The EPC endorsed the staff recommendation that the Hetch-Hetchy right-of-way be allocated 11 units of development per acre somewhat lower than the density attributed to the main parcel. This bonus would amount to four units generated by the Hetch-Hetchy right-of-way and 22 units by the remaining privately owned property (about 26 units total). This density is substantially below that of the 45-unit plan approved over 10 years ago; however, it is consistent with the Council's direction for lower density on the Klein School site.

The Planning Commission endorsed the basic provisions of the R3-3* District for site development criteria with additional guidelines added by the precise plan for use of the Hetch-Hetchy parcel. The Commission also recommended that a section be added calling attention to the presence of existing specimen trees. They recommended deletion of the staff-suggested reference on Item IIIC4 to use of "talented, experienced, recognized architects."

As noted in the Background section above, this property was originally included in a 1974 development plan. This plan was modified shortly after Council approval, and only 75 of the originally approved 120 units were built. The remaining two acres of land were presumably to be developed with 45 units at a future date. However, the owner has taken no further action to implement this additional development during the last 12 years. Normally, Planned Community permits are granted for a period of one year, and failure to renew an approval leads to the need for a new application.

The property owner, Mr. Pear, spoke before the Planning Commission arguing that the permit should still be valid since he has contributed to the recreation fees for the total number of units. The City Attorney advises that the applicant no longer has a valid PC permit. No building permits were ever obtained for the development and the project approval has expired. As such, the property owner no longer retains a vested right in the 1974 approval.

Alternatives

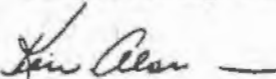

The Council could:

1. Modify the recommended basic density; or retain the 1974 Planned Community permit density.

COUNCIL AGENDA
April 22, 1986

- 115
2. Increase the incentive for use of the Hetch-Hetchy right-of-way by giving it full credit for the area.
 3. Drop the incentive approach and adopt a standard zone which does not contain any specific incentive or requirement for use of the Hetch-Hetchy right-of-way.

Respectfully submitted,

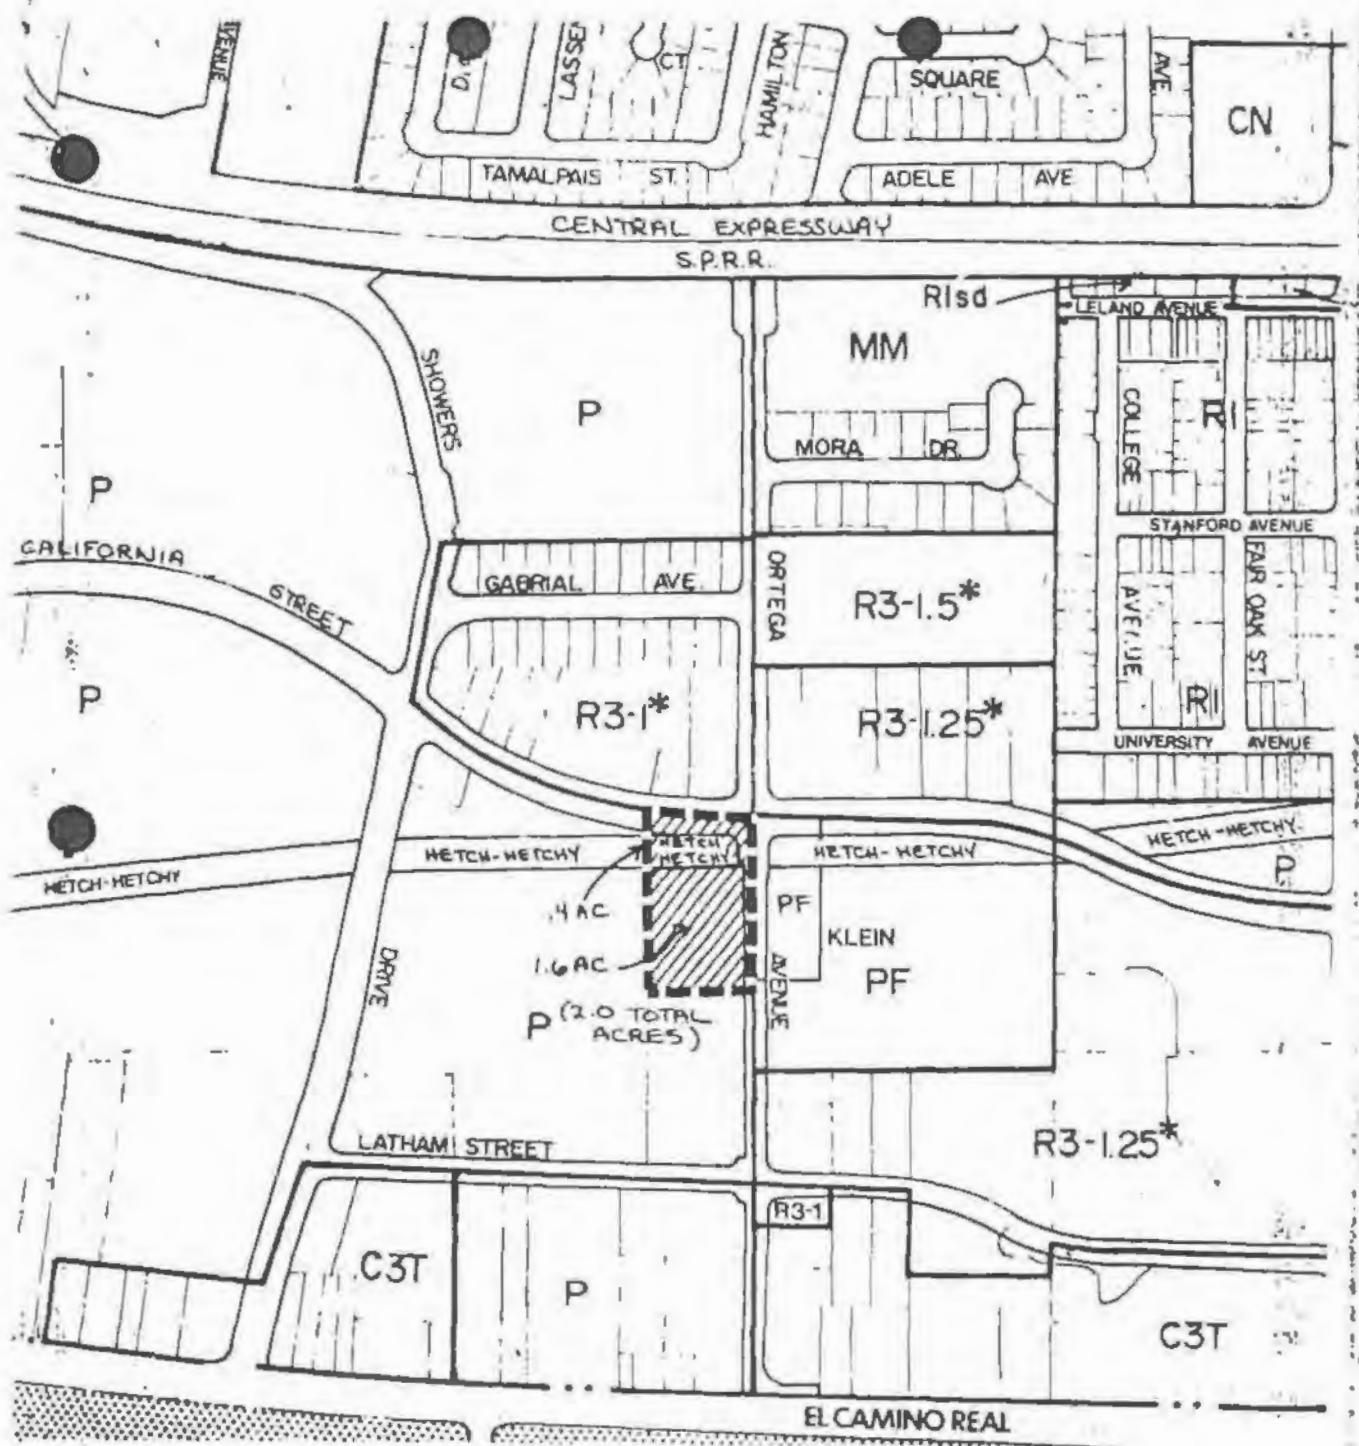

Ken Alsmann, Secretary
Environmental Planning Commission

COUNCIL AGENDA
April 22, 1986

 Area under consideration
394 ORTEGA AVENUE

EXHIBIT I

Exhibit II

PROPOSED PRECISE PLAN--394 ORTEGA AVENUE

APRIL 1986

RECOMMENDED BY THE
ENVIRONMENTAL PLANNING COMMISSION

I. Description

The Precise Plan covers the property located at the southwest corner of Ortega Avenue and California Street, and the adjacent portion of the Hetch-Hetchy right-of-way. The land is located at prominent corners close to existing and proposed lower- and medium-density developments as well as higher-density residential uses. The General Plan designates these areas for residential use at 12+ dwelling units per acre.

II. Development Concept

The site can be developed with medium-density housing providing large-size units with the potential for owner occupied family housing. Any development must fully incorporate the Hetch-Hetchy right-of-way. The Plan provides density bonus incentives for incorporation of the Hetch-Hetchy right-of-way.

III. Use and Development Criteria

A. Moderate-Density Housing

The R3-3* Districts shall be used for density (14.4± units per acre) and general site development criteria. The base density shall apply only to the privately held portion of the property.

B. Hetch-Hetchy Density Bonus

The Hetch-Hetchy right-of-way shall be fully incorporated into any development. An additional density of 11 units per acre is permitted for each acre of the Hetch-Hetchy right-of-way.

C. General Criteria

1. The site layout, unit design and project amenities shall be designed to provide ownership potential in large units which can adequately accommodate families with children.
2. Townhouse type building fronts and entrances shall face each of the major streets. Neither carports nor garages may be oriented to the streets.
3. The Hetch-Hetchy right-of-way area shall be fully incorporated into the landscape and overall site design. At least 70 percent of the right-of-way shall be landscaped.
4. In keeping with these prominent locations, special emphasis shall be given to architectural and site design excellence. Use of talented, experienced, recognized architects is essential.
5. The site design and elevations shall strive to create a quality residential character with sloped roofs, multiple roof lines and attention to texture, detail and color.
6. Special attention shall be given to preservation and incorporation of the existing heritage trees on the site.

D. Administration

All major developments shall be reviewed by the Zoning Administrator and approved by the City Council per Section 32.22.6 and 36.22.10 of the Zoning Ordinance. Once a major project has been approved, uses which have been identified as principle permitted uses and provisional uses within the R3-3* District, building expansions and modifications and sign program changes may be granted by the Zoning Administrator after appropriate public hearings as per Section 36.22.6 through 36.22.8.

Upon granting of the Planned Community Permit, the approval of minor sign program changes, the approval of specific signs, the approval of minor sign

changes and building alterations, including building material changes and uses which are in conformity with the Precise Plan, may be authorized through the Site Plan and Architectural Review (SPAR) process.

CITY OF MOUNTAIN VIEW
STATE OF CALIFORNIA

CALIFORNIA ENVIRONMENTAL QUALITY ACT

NOTICE OF DETERMINATION

Application No.: 62-86-PPA

NAME OF DEVELOPER: City of Mountain View

ADDRESS OF DEVELOPER: 444 Castro Street, Mountain View, CA 94041

PROJECT DESCRIPTION (including name if any) AND ADDRESS: Proposed Precise Plan Adoption/Amendment: Southwest Corner of California Street and Ortega Avenue

NEGATIVE DECLARATION

PROJECT LOCATION AND ENVIRONMENTAL SETTING: The site is located at the southwest corner of California Street and Ortega Avenue, both heavily traveled streets. The project is traversed by the Hetch-Hetchy right-of-way, which contains underground water lines and cannot be built upon. The right-of-way consumes 22 percent of the total site area. The site is currently undeveloped and is in a multi-family residential area opposite the Klein School site, which has also been designated for multi-family residential use.

BASED ON THE INITIAL STUDY FOR THIS PROJECT, IN THAT the proposed amendment actually decreases permitted densities from the original Precise Plan, potentially decreasing adverse environmental impacts.

IT IS CONCLUDED THAT THIS PROJECT HAS NO SIGNIFICANT ENVIRONMENTAL IMPACT. Determination by Alison Kendall which adoption shall become effective.

Alison Kendall

INTER-OFFICE MEMORANDUM

filed

DATE: March 11, 1986
TO: Ken Alsman, Principal Planner
FROM: Robert Logan, Special Counsel
SUBJECT: Property at corner of Ortega and California

394 Ortega

Having reviewed your staff report to the Environmental Planning Commission, I feel our discussion needs some clarification. The change of use of Parcel B cannot be undertaken without risk of being overturned.

This office's conclusion that the property might be rezoned was based on several caveats. The first related to the question of whether improvements and expenditures on Parcel 'A' gave some vested rights to develop Parcel 'B'. I do not think that issue is resolved based on the sketchy information we now have. The one year expiration of the permit is not cast nearly as clearly as your memo implies. In fact, I recall advising you that the one year provision we looked at did not support that conclusion.

Any representations you make should be made with a clear understanding that the property owner may have rights to continue to develop at the present level of density. I don't want the Commission to be misled into thinking that the proposed change will occur without any legal ramifications.

EXHIBIT F

Messrs. Joe & John Pear
394 Ortega Avenue
Mountain View, California

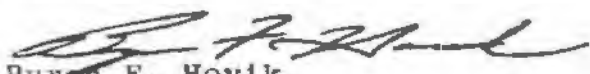

Dear Joe & John:

As I explained during my last chat with you, we are stopped from getting our permit until you accomplish two things:

1. Give Len Cornwell of the Mountain View staff your check for your share of the fees required by the City.
2. Sign the affidavit forms agreeing to the use of city sewer and water hookups. Len told me that he sent the original copies to you last January, 1974 for your signature. Apparently they were not returned by you, so the City Attorney requires both our signatures. We signed the copies and left them with Len. Please go in and sign them as soon as you can.

We are most anxious to proceed and hope that you will respond quickly.

Very truly yours,

Byron F. Hovik
President

BFH:mec

This report is submitted at this time to Merlone Geier Senior Partners, Greg Geertsen, David Geiser, Michael Grehl and Joe Nootbaar, Project Manager of Design and Construction for their clarification and rebuttal. The authors will subsequently release this report and the Partner's critique to the Mountain View City Planning Commission. The developer's plot plan is used as a common base for discussion.

**Analysis of Vehicle & Pedestrian Traffic in the Phase II
Development in the San Antonio Center**

D. Pilling & S. Friberg
9/7/2013

RECEIVED
SEP 16 2013

PLANNING DIVISION

The purpose of this report is to anticipate Phase II traffic conditions. This project is moving forward possibly ignoring traffic consequences which are enormous for business viability, the developer's credibility and the negative impact on residents and property owners. This study summaries detailed engineering analysis and reflects the thoughts of many of those the Center is still an important part of their well being and those who simply drive on San Antonio Road and California Street.

This study introduces traffic issues into the architectural design. A contracted traffic study to an outside vendor by the City of Mountain View Planning Department is just beginning and does not appear to be in phase with the current proposed design. In this case the ten acre space with over one million square feet of development will overlook and have serious traffic and safety issues. If not resolved at this time, traffic congestion will propagate into adjacent main thoroughfares such as El Camino Real, San Antonio Road and California Street.

This report is not intended to prevent what we consider reasonable development in the Center but we wish to minimize congestion with public safety foremost in mind while minimizing changes in the proposed development. We dearly hope that our analysis and recommendations be taken seriously by the developers and the City of Mountain View Planning Commission.

Three sets drawings are provided by Merlone Geier for the Phase II development of the San Antonio Center in Mountain View. One set of the drawings titled "THE VILLAGE" dated July 26, 2013 present three dimensional architectural views of individual buildings projecting open space with a noticeable lack of cars. The second set are plot plans of each level: ground, basement, above ground, drawn to scale and dated 5/17/2013. There is an earlier set of drawings titled "THE VILLAGE AT SAN ANTONIO CENTER – PHASE II" dated February 19, 2013 with statistics such as the number of square feet of office space and required parking spaces. These numbers are listed in Appendix A. This type of information is a critical base for the analytic assessment of concentrations and flow of traffic in Phase II.

Conclusions

It is found necessary to modify the original Phase II proposal submitted by Merlone Geier in order to resolve traffic congestion in the following way:

- 1. Silicon Way becomes two lanes in one direction from San Antonio Road to Pacchetti Way.**
- 2. Pacchetti Way is enlarged from two lanes to four lanes within Phase II boundaries.**
- 3. The theater lobby is moved from the Promenade/Silicon Way intersection to Pacchetti Way.**
- 4. Building #3 becomes a flow through surface parking area.**

Discussion

The segments of California Street bounded by San Antonio Road, Showers Drive and between El Camino Real and California Street are a primary focus of traffic conditions for Phase II planning. This report proposes changes in traffic flow which challenges the developer's design not with the intention of downsizing the magnitude of the project but distributing traffic from these congestion areas. Presently the traffic in these segments is marginal. This changes with the addition of an

eight auditorium theater with traffic comparable to the theater traffic at Shoreline, a 7 story hotel on Pacchetti Way, two six story offices buildings on San Antonio Road. It is clear that this development is driven by a projected \$2 million yearly city revenue on retail and theater sales. Nonetheless traffic congestion attenuates revenue on retail sales and reduced occupancy. The sheer magnitude of the proposed development in 10 acres makes a completely viable solution difficult.

Traffic Flow in the Phase II Development Proposal

The traffic flow of Figure 1. is drawn on the developer's plot plan. We assume:

1. Pacchetti Way, Silicon Way, Disk Drive, the Promenade are single lane roadways in each direction. The Hetch Hetchy park is bounded by single directed lanes to and from Pacchetti Way and San Antonio Road. Pacchetti
2. Way is the main internal thoroughfare through the Center from El Camino Real to California Street. Police and fire emergency response vehicles cannot effectively operate in the crowded single lane traffic on Pacchetti Way. Pacchetti Way needs to be made four lanes in Phase II.
3. The intersection at Pacchetti Way and California Street requires signal light synchronization with signal lights on California Street and Pacchetti Way which is in turn are synchronized with the signal lights at the San Antonio Road/California Street and California Street/Showers Drive intersections.
4. Reverse driving directions in Phase II must be made inside parking areas or wrapping around major roadways.
5. The 1962 Reciprocal Parking Agreement (RPA) allows all to park in any parking space with the exception of the three properties on the corner of San Antonio Road and California Street. Reciprocal parking is unresolved for parking structures as well as a method of parking enforcement & control. For instance Jo Ann Fabric's and Kohl's parking areas may well be swamped by theater goers and hotel guests. The downside of parking in these areas requires pedestrians to cross heavy traffic on Pacchetti Way.
6. Traffic attendants are needed to direct traffic for cars entering the up and down ramps on Silicon Way in Building #5 adjacent to the Silicon Way/Pacchetti Way intersection.
7. The variable in and out ramp is added to improve accesses times will require attendants at six parking levels, but may unfortunately contribute to congestion at the ground level ramp entrances and exits.
8. Refer to Figure 3. Silicon Way enters a building tunnel next to the parking ramps with an entrance 23' wide and 20' feet high with an overhang of 5 levels of parking extending 270'. Exhaust fumes will become unbearable if 60 cars become stalled in both directions in the tunnel. (Allow a space of 18' for each car, 15 cars in both tunnel lanes, times 2 for each lane plus 30 cars waiting for vacancies in the 135 spaces in the ground level parking.) The exhaust fumes are only vented in five entrance ports in an otherwise sealed space as shown in Figure 4.
 - a. Traffic congestion in the tunnel area will result in high levels of exhaust fumes.
 - b. The tunnel is not designed for emergency fire or medical vehicles much less allowing the passage of large delivery trucks. (Vehicle sirens and size and diesel exhaust to name a few reasons.)
 - c. Florescent lighting in the enclosed area is less effective than daylight contributing to a loss of safety.
 - d. Permanently stationed traffic attendants with flash lights need to control and direct traffic inside the tunnel as noted for the parking garage at the Palo Alto Medical Clinic on El Camino Real.
 - e. Ambulances and police cars will not be able to use the tunnel. Car cannot pull over and let emergency vehicles pass in single lane traffic. Sirens would be unbearable in the tunnel enclosure.
 - f. Vehicles emitting high pollution such as those using diesel fuel will not be allowed in the tunnel. The majority of ground level parking should be reserved for electrical vehicles.
9. An additional theater lobby at the second floor in Building #6 connected to the Building #5 parking garage will substantially reduce ground level pedestrian traffic crossing Silicon Way at the Promenade intersection.
10. Pedestrian safety is in question on the Promenade allowing cars a thoroughfare from Silicon

Way to Disk Drive.

11. Major congestion will be created by trucks backing into three loading building slots:
 - a. At the loading slot at the intersection of Pacchetti Way and Silicon Way for Building #6,
 - b. At the loading slot provided for Building #1 on Disk Drive,
 - c. At the loading slot provided for Building #2 on Silicon Way.
12. Theater traffic congestion is created by transporting theater goers to and from the intersection of Silicon Way and the Promenade.
13. The office buildings #1 and #2 have 29' wide "Ramp to below grade Parking" to support incoming as well as outgoing traffic. A possible would be for this ramp becoming exclusively two lanes of incoming traffic during morning and outgoing rush hours for 6 stories of office workers controlled by parking attendants.
14. Southbound cars on San Antonio Road making left hand turns onto California Street add to the congestion on California Street and the San Antonio Road intersection.
15. Cars arriving at the theater are limited by the waiting distance along California Street from the San Antonio Road intersection to the theater destination.
16. Cars on the Promenade must make a right hand turn entering California Street.
17. The theater lobby at the intersection of the Promenade and Silicon Way will contribute to congestion in the tunnel. Cars for the theater are offered several options:
 - a. Cars from the ground level parking can go forward to San Antonio Road.
 - b. Cars traveling to the lobby from San Antonio Road on Silicon Way can go either right or left on the Promenade.
 - c. Cars from the multi-story parking garage in Building #5 may choose to turn right on Silicon Way to finally exit onto California Street.
 - d. Cars on the Promenade must also turn right on California Street.
18. The maximum theater traffic will occur during programming changes for estimated at 425 cars in a 45 minute period for popular showings during daytime and evening showings. Additional seating is occupied with pedestrian traffic. (Data obtained from the Shoreline Theater Complex.)
19. The three Building #2 commercial (retail) sites facing San Antonio Road seem a less desirable location for pedestrians walking from the Promenade by crossing loading and ramp entrances on Silicon Way or challenged by cars crossing Silicon Way along San Antonio Road. Perhaps office use would be better than stores facing San Antonio Road.
20. The Silicon Way exit 190 feet from the intersection at San Antonio Road adds serious congestion to the intersection of San Antonio Road and California Street.
21. Silicon Way is a main exit, discharging office workers in a short but critical distance from the San Antonio Road and California Street intersection. This intersection is already overloaded as reported in *Traffic Growth on San Antonio Road in Los Altos, Mountain View and Palo Alto Due to New Development* attached to this study. Similarly, Disk Drive and the road bordering Hetch Hetchy add additional cars to this intersection.
22. Cars driving south on San Antonio Road intending to enter the office parking garages on Silicon Way and Disk Drive will reversing direction with U-turns on Fayette, returning on San Antonio Road toward California Street then turning right for the Bldg #1 and #2 office garages.

Analysis of Pacchetti Way and Silicon Way Traffic

Refer to Figure 2.

Figure 2 is an enlarged plot plan of the corner section of the Phase II with traffic flow arrows. Silicon Way has a single lane in each direction. Four internal congestion locations are labeled, specifically nodes 1, 2, 3 & 4. Note the building tunnel drivers must enter when turning onto Silicon Way from Pacchetti Way.

Node 1, the intersection of Pacchetti Way and Silicon Way

Drivers approach the Pacchetti Way/Silicon Way intersection from four directions. First drivers from California Street may go straight on Pacchetti encountering cars attempting left hand turns onto Pacchetti Drive from Silicon Way. Cars from Jo Ann Fabrics may attempt crossing Pacchetti

Way across your path. Cars from Silicon Way may also cross the driver's path making a left hand turn onto Pacchetti Way toward California Street. Worst is a semi truck parked in the middle of the intersection attempting to back into the loading zone. The driver may attempt to make a left hand turn to Jo Ann Fabrics and encounter cars going straight to California Street. Other options may be noted on the flow diagram.

Drivers from both Pacchetti and Silicon Way must be wary of pedestrians at crosswalks.

Semi-trucks using the loading zone at the intersection of Pacchetti & Silicon Way will need to first pull forward on Pacchetti then back their trucks into the loading zone shown in Section 6. This maneuver will block all cars from entering or leaving the intersection at Silicon Way. These conditions are equally hazardous when loading trucks exit the loading zone, one of three ways: A forward direction to El Camino Real on Pacchetti swinging into traffic on Silicon Way or going forward and make a hard left hand turn returning to California Street or El Camino Real on Pacchetti Way.

Drivers entering the street in Front of Jo Ann Fabrics can join cars bound for California Street, go straight onto Silicon Way or turn left into oncoming traffic on Pacchetti Way or pull a hard right hand onto Silicon Way towards San Antonio Road. In all cases the loading zone will stop traffic at this location. Both north and south bound cars on Silicon Way will make left hand turns against on coming traffic prompting a need for traffic lights at this intersection.

Pedestrians crossing Silicon Way at this intersection must be aware of traffic in both directions.

Node 2

Drivers on Pacchetti turning onto Silicon Way enter a ground level building tunnel. Overhead is a six story parking garage, underground is an additional parking garage. Inside the tunnel the driver must adjust from sun light to fluorescent lighting before going forward. The tunnel height must accommodate delivery trucks.

Additional parking ramps are on the Disk Drive side of Bldg #5.

Drivers entering the tunnel on Silicon Way have a number of choices inside the building tunnel in both directions on Silicon Way. From Pacchetti Way, drivers turn left across oncoming traffic on Silicon Way into three entrance ramps into the parking garage in Bldg #5; one ramp to an upper level, a second to a lower level and a third level for either designated level. A ramp to the upper levels is the first entrance to the parking garage in Bldg #5 on Silicon Way is for cars turning from Pacchetti Way. There will be a contest between cars attempting to enter the ramps with cars driving to or from Pacchetti Way on Silicon Way .

The Palo Alto Medical Foundation needs several attendants with flash lights at a similar ramp entrance. Drivers may turn left into a mini-ground level parking area in Section #6.

Nodes 3 & 4

Drivers on Silicon Way may make a additional right hand turn into a mini-parking area as in Node 2. The driver may intend to shop in the retail stores in Bldg #6 parking in the mini-parking space. If no parking is available in the min-parking area, the driver may cross into the ground level parking in Bldg #6. If still not successful in locating a parking space the driver may turn left on Silicon Way and make a right hand turn into a ramp to alternate parking spaces in Bldg #5. The driver will need to merge with and cross multiple directions of traffic for what ever the decision. A similar scenario for leaving the parking areas available in Bldg #5 can be shown in Figure 2.

Maximum exhaust ventilation will be needed in the tunnel during traffic congestion.

Recommended Changes in Traffic Flow

Refer to the revised traffic flow on the plot plan of Figure 5 for an improved flow:

1. Pacchetti Way becomes four lanes traversing California Street entering and exiting from Phase I development. Pacchetti Way is a main artery for this development receiving cars from California Street, parking areas from Showers Drive, traffic from San Antonio Road and traffic and Phase I development.
2. Signal lights are necessary at the Silicon Way and Disk Drive intersections with Pacchetti Way to support and control traffic flow.

3. Cars from Showers Drive will arrive and exit from parking areas facing Pacchetti Way.
4. The theater lobby at the intersection of Silicon Way and the Promenade to Pacchetti Way near California Street must be relocated to Pacchetti Way. The original location of the lobby would place spike congestions at the Promenade/Silicon Way in the same manner observed at the Shoreline theater at the end of a film showing. The new location on Pacchetti Way provides a temporary car pick-up and drop-off for theater goers. A location for buses waiting near the theater lobby is located on California Street near Pacchetti Way. In addition theater goers will find to their advantage to be dropped off on the Commons side of California Street and with a short walk with the light signal enter the theater lobby.
5. Silicon Way traffic is two lanes directed with an entrance at San Antonio Road proceeding to Pacchetti Way, so as to:
 - a. Allow easy access to California Street from San Antonio Road bypassing the intersection of San Antonio Road and California Street,
 - b. Allow cars to move forward to Buildings #5 & #6 parking or turning left toward California Street,
 - c. Allow cars to freely make right hand turns into Building #2's below ground parking garage without blocking cars proceeding forward on Silicon Way.
 - d. Reduce congestion in the Building #5 tunnel. Compare tunnel traffic in Figures 1 & 5.
 - e. Reduce exhaust and ventilation necessary for the enclosed ground level parking in Building #6 by rerouting traffic to Disk Drive.
 - f. Moving traffic from the tunnel in Silicon Way into the open air of Disk Drive. Disk Drive remains with single lanes directed in both directions. An additional roadway from Pacchetti Way to San Antonio Road is available with the single one-way lane on Hetch Hetchy Drive compensating for the loss of the redirected lane on Silicon Way. A second lane on Hetch Hetchy would welcome more traffic.
 - g. Replace Building #3 with surface parking allows third lane access into California Street relieving two lanes proceeding from San Antonio Road unobstructed toward Pacchetti Way.
 - h. Seal off the Promenade between Silicon Way and Disk Drive so that shoppers and office workers may safely cross to restaurants and retail shops on both sides of the Promenade.
 - i. Add short time surface parking on Silicon Way and Disk Drive for retail stores on the Promenade.
6. Relocate the market originally located at the California Street/Pacchetti Way intersection to the Promenade/Silicon Way intersection. This allows market shopping to be integrated with restaurants and retail with nearby office workers.
7. Relocate loading area for delivery trucks with parallel lane parking to deliver good and pick up trash without blocking traffic as shown in Figure 5 for Buildings #1, #2 & #6.
 - a. The parking area for delivery trucks in the relocated market is moved to the Promenade facing California Street.
 - b. The parking area for delivery trucks in Building #2 has been moved from an internal loading slot to a parking area parallel to Building #2 on Silicon Drive.
 - c. The parking area for delivery trucks in Building #1 has been moved from an internal loading slot to a parking area parallel to Building #1 on Disk Drive.

Appendix B. BREAKDOWN OF PARKING USAGE TO DETERMINE TRAFFIC FLOW

PARKING USAGE FOR BLDGS 1 & 2

LEVELS	# OF STALLS	OCCUPANCY	USE
BASEMENT 1	251	240	OFFICE WORKERS/SHOPPERS
BASEMENT 2	251	190	OFFICE WORKERS
BASEMENT 3	<u>251</u>	<u>30</u>	EMPLOYEES
TOTALS	753	460 or 61% average usage	

PARKING FOR BLDG 5

	Total Available	Projected Peak Usage	Users
BASEMENT 1	171	135	SHOPPERS/EMPLOYEES/THEATER
LEVEL 1	165	165	SHOPPERS/THEATER
LEVEL 2	157	140	SHOPPERS/THEATER
LEVEL 3	157	125	SHOPPERS/THEATER
LEVEL 4	157	110	SHOPPERS/THEATER
LEVEL 5	157	90	SHOPPERS/THEATER
LEVEL 6	<u>157</u>	<u>50</u>	SHOPPERS/THEATER
TOTALS	1,121	815 or 73 % during peak theater hours	

PARCEL 6 SURFACE PARKING with 40 spaces for electric or handy capped parking.

The number of people going to a movie theater varies with interest and appeal. Say for instance a “must see” movie is playing and 515 parking spaces are used from 800 spaces available in the parking garage. One hundred nearby residents from the Commons attend. The theater auditoriums are packed. The evening showing ends at 10:00 PM.

Appendix C. Usage Control of Parking Garages in Buildings 1, 2 & 5

Equivalent to system in place for longterm multilevel parking at SFO. Typically a **two minute wait** for a single car ramp lane to receive payment parking tab or office worker pass to raise entry bar. Assume or 40 seconds is required to go to each higher level or 3 & ½ minutes to go to the 5th level. A similar time is required to exit the parking garage from the 5th level.

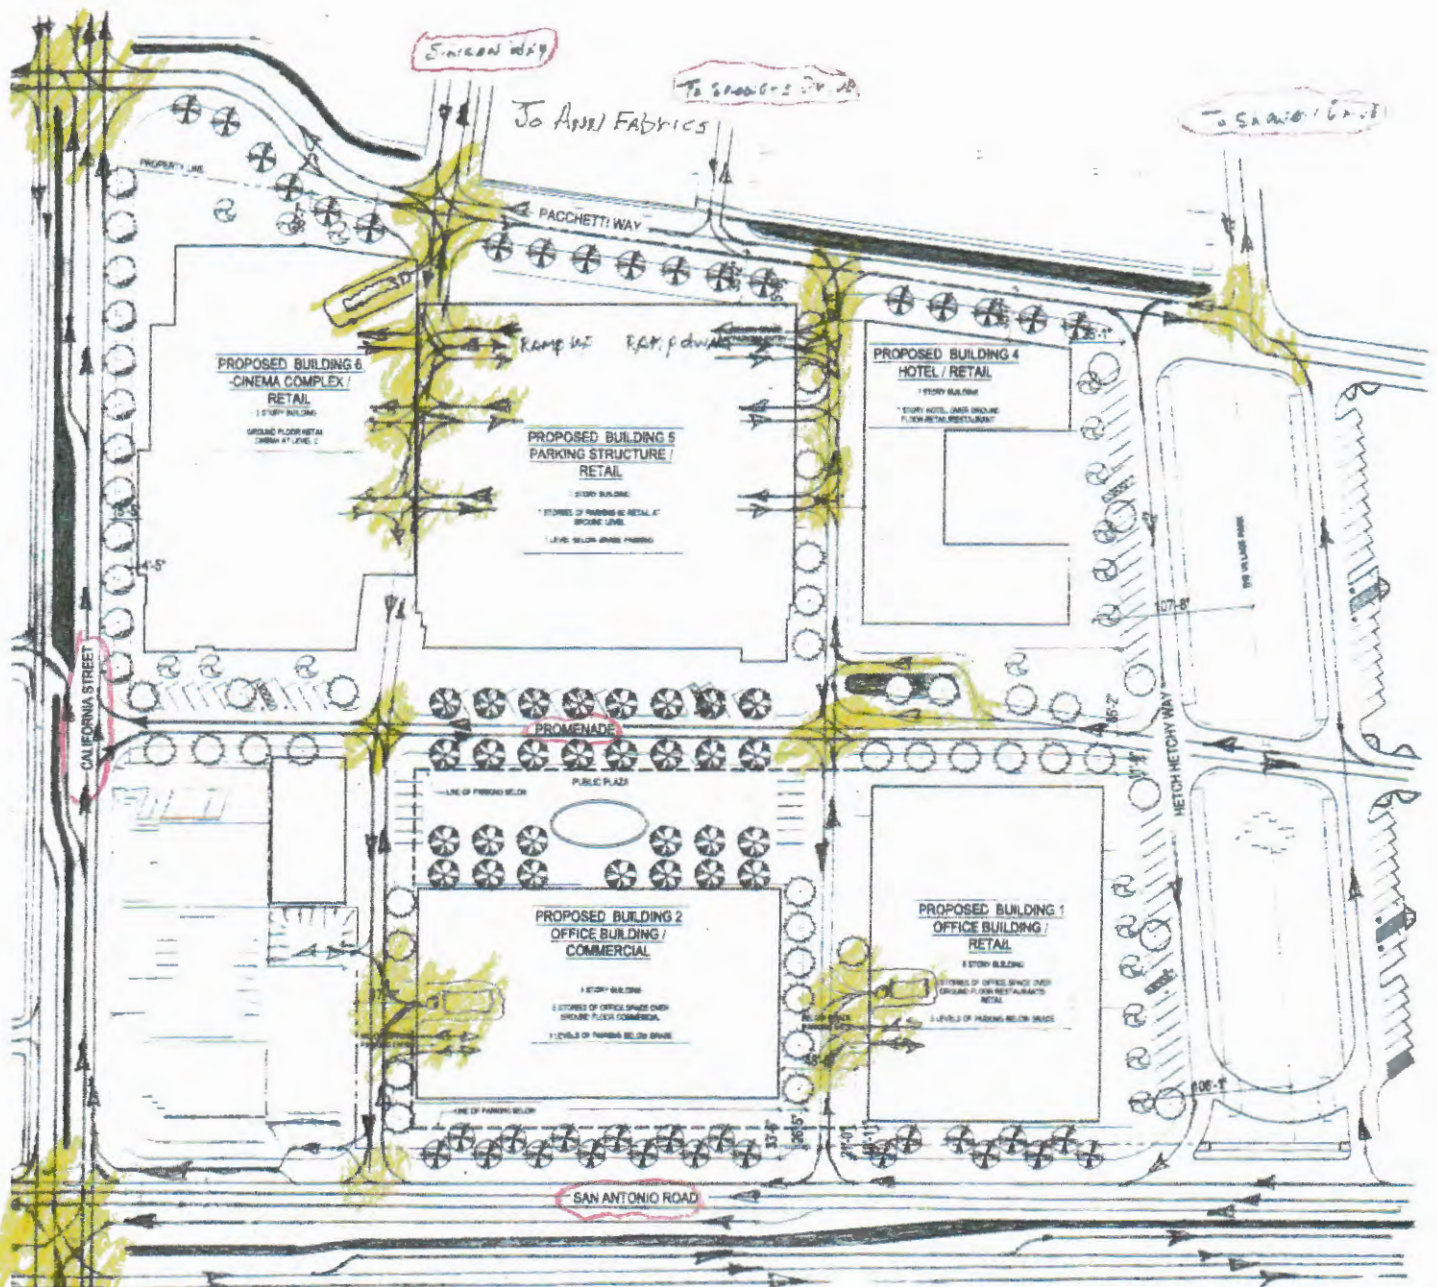

Appendix D. Peak Traffic Conditions for the 8 Auditorium Theater Complex

Assume the integral of Gaussian distribution of theater goers in a one hour movie showing change over is 425 parking used, (Appendix 1.) accounting for pedestrian public transportation. Dividing 425 by 3 ramp lanes in use equals 142 cars for a one hour movie change over affecting parking or an average of 2.36 minutes entrance wait time for each car. According to the manager of the Shoreline theater complex popular movie showings will substantially increase the number of movie goers.

Appendix E. Traffic Conditions for Office Buildings 1, 2 & Parking Garage in Building 5

The total volume of cars entering and exiting office complex garages from 7:00 AM to 10:00 is estimated to be 515 cars from the 2,354 spaces provided or 67% usage in Buildings 1 & 2.

Anticipated peak flows are projected to occur in morning hours from 7:30 AM to 9:30 AM for office workers arriving for work, a lesser peak at noon time hours lunch hours and another peak for workers returning home between 5:00 PM and 7:00 PM.

Subject: EIR - Scoping input from Steve Rasmussen

Hello Margaret,

I have attached in document form a few thoughts from my perspective concerning the Phase II San Antonio Center development. I have also attached a communication I had in January 2011 regarding the Phase I EIR. I do not know if you are familiar with the amended San Antonio Center Precise Plan, but it did not include the historical shared parking language that clearly was expected based on the response to my letter of January 15, 2011 by the Planning Process. I believe that it is the right thing to do at this time to re-establish the historical shared or "open" parking policy that had been embedded in the function of the San Antonio Center for decades.

You may know that I have owned and successfully operated the Milk Pail Market at its current site for thirty nine years. Over those many years, buildings and developments come and go. I'm thinking now of the Old Mill Shopping Center, the Mayfield Mall, Gemco, and many smaller businesses that once dotted the landscape.

What is truly remarkable is the density proposed for the Phase II project.

Include the other pending projects that are before the Mountain View Planning Department for both the San Antonio / El Camino region and the projects pending for other Mountain View regions and it is truly difficult to imagine the consequences of such development growth. I am not inherently opposed to development and growth, but having been to Shanghai, I have seen how development can lead to traffic gridlock.

Lastly, I want to say that it is my hope that a truly unbiased and professional Traffic Study is undertaken and overseen by the very capable planning staff of Mountain View. As I mentioned above, the collective pending developments both near to and away from the San Antonio/El Camino corridor could very likely have an immeasurable negative impact on the quality of life for all of the residents who live in Mountain View and in the nearby communities.

I believe this Environmental Impact Study will have long term consequences for many years into the future for the people of Mountain View and neighboring communities.

Sincerely,
Steve Rasmussen
The Milk Pail Market

Re: Phase II EIR Scoping

Dear Margaret:

The Phase II EIR study will have a multitude of issues to evaluate. I want to make sure that the following issues are considered.

Historically, the San Antonio Shopping Center shared open-air parking. The effects of the closed high rise system being proposed needs to be studied in terms of circulation, impacts of stacking (gridlock) of cars at the entries, etc.

Consistency of this Plan with General Plan 2030 which specifies open circulation modes and access for all properties needs to be addressed.

The pending Phase II plan has buildings that will tower over my small Open Air Market in such a way that light may no longer shine bright on our popular business, so shadowing studies are needed.

The traffic analysis may demonstrate the need for major street modifications to occur if the current Phase II plan were to be approved. The impact on my property of any proposed modifications needs to be assessed.

Sincerely,

Steve Rasmussen
Owner

LETTER B4
Steven Rasmussen
January 15, 2011

B4-1: The Precise Plan will require shared access, shared parking and coordinated parking for adjacent properties. The residential uses included in the proposed project will be required to provide private parking.

B4-2: The site plan shows a continuous driveway between El Camino Real and the existing driveway at the northeast corner of the project site, which will connect to California Street. The project will remove existing buildings that currently prohibit this direct connection.

The proposed project retains most of the driveways onto El Camino Real and San Antonio Road. These driveways will provide the same emergency access to various areas of the site as are now provided.

B4-3: The majority (71 percent) of the units are studio and one-bedroom units and are not expected to be rented by families. The activity of tenants moving in and out of the apartments is considered a temporary event lasting a short duration of time and would not result in a significant impact to internal circulation. This comment pertains to the design of the proposed project, and does not relate to the adequacy of the information or analysis within the Draft EIR; no further response is required.

Subject: San Antonio Center Development

Hello Scott,

Thanks for allowing me chance to read thru the two part booklet containing the San Antonio Center EIR on Thursday. I came back Friday and finished most of the booklets. I asked to see you but heard you were out of the office. I also took the opportunity to speak with Ellis Berns from Economic Development.

I am glad that after decades of blight like existence, a part of the San Antonio Center is being considered for a huge "make over". It is a wonderful opportunity for the City to see a creative and purposeful project that will be the "Talk of the Town" and perhaps even the county. If the project is conceived for only economic gain, with a maximum allocation of building and a minimum application of creative design that considers both current and new businesses, the promise of realizing this wonderful opportunity may be lost for another fifty years.

I have three (3) main concerns from reviewing the pending proposal.

- 1) **PARKING:** As I understand the drawings, the retail development will include building on the North section of the 16 acres that borders the Ross / Bev Mo building. As the City must be aware, that building and all of its tenants over the past forty years have had customer parking on the ground surface that appears now to be planned for about 120,000 sq feet of new construction. A) Where will the customers of the Ross / BevMo building park if the parking area that is provided to them presently thru reciprocal parking agreements and parking licenses is removed? This seems to be an enormous problem, given the success of the businesses located in the Northeastern quadrant of the San Antonio Center. B) Even the businesses that front San Antonio Road that benefit from long standing usage of this parking area will be greatly impacted if parking is restricted by the proposed development of approximately 120,000 sq. ft. of additional retail sales area. 1

- 2) **INGRESS/EGRESS/EMERGENCY ACCESS:** It is not obvious if there will be a continuous surface roadway from the Northwest section of the 16 acre parcel (CVS Pharmacy location) to California Street. It has always been the intent of the current San Antonio Precise Plan to promote and allow traffic flow and parking between all properties. In addition to this, what kind of Emergency Vehicle movement is being provided for if the narrow planned roadways were blocked by burning buildings, a Hetch Hetchy pipe break, or collapsed walls from an earthquake ? 2

- 3) **RESIDENTIAL COMPONENT RAMIFICATIONS:** The San Antonio proposal calls for an apartment complex of some 350 units. It is my understanding that these are apartments, not townhouses nor condominiums. After having been intimately familiar with the San Antonio Center for the past thirty six (36) years because of my ownership of the Milk Pail Market, I cannot imagine how such a high density use for rental housing, or any other type of high density residential use, fits in a busy public marketplace. This housing proposal is not a creative application of a few artist lofts or living/ work units. It is a series of apartment buildings where children will live; children who have tricycles, bicycles and skateboards - and all in the midst of Tractor Trailors and Bobtail trucks delivering goods continuously to the retail businesses surrounding the apartment buildings. When the traffic impact of tenants moving in and out of the heart of this new development is included in the traffic equation, common sense would seem to suggest that this is not a reasonable use of the area that has always been referred to as a "Shopping Center". 3

I appreciate the opportunity to submit these comments for consideration.

Respectfully submitted,
Steven Rasmussen
Owner (since 1974)

Subject: 405 San Antonio Road

Hi -

I received a notice in the mail regarding a hearing to discuss the development at 405 San Antonio Road. I was unable to attend the hearing, but I hope that my comments can still be taken into consideration. My home is blocks away from this development and I primarily wanted to write to voice my objection to the building of a movie theater on this site. There are much better options for this development - restaurants, markets, shops. With all the new residential properties in the area (part of phase 1 of the development), it would be fantastic to have food and shopping options for those people (and those of us already living in the neighborhood) that we could walk to, much like for residents near downtown Mountain View. This type of development seems like it would be an improvement to the livability and value of the homes in our neighborhood. A movie theater would probably have the opposite effect - not to mention, that there is already a movie theater very close by on Shoreline. I appreciate your efforts to solicit opinions from the community, and I sincerely hope that you will take those into consideration in your development plans.

Thank you,
Daniel Smith

Cc: Indira Subramanian
Subject: Email-4 : San Antonio - Phase 2 -- NIGHTMARE on San Antonio Road

Dear Council Members John, Chris, Margaret, Ronit, Michael, John, Jac Dear Phase-1 Lead Nancy and Phase-2 Lead Melinda:

Please consider these series as the expression of HELPLESS residents who are watching their neighborhood becoming unlivable because of high-density development namely the San Antonio Center.

We have written Email-1, Email-2, Email-3 each with substantial and distinct points about the unviability of Phase-2 development as proposed in the recent 30-page document featuring 6 buildings ranging from TWO to SEVEN stories!!!

- office (392,855 square feet)
- commercial / retail & restaurant (118,050 square feet)
- hotel (142,085 square feet with 167 rooms)
- above ground parking and building service area (504,095 square feet)
- cinema (67,280 square feet with 1,710 seats)

Just about anyone that has driven by Phase-1 apartment complex exclaim "what on earth are these unfortunate buildings?".

Add anything more than 2-story buildings to this already congested San Antonio Shopping Center Phase-2, the exclamations will be "what were they thinking?"
"Was anyone thinking at all?".

(0)

-- If you want to do high density and create a complete complex with apartments, retail, offices, movie theaters, etc., etc. -- it is a very self-sufficient community you are building. Why plunk this "complete community setup with ALL amenities" in the middle of a busy / narrow San Antonio Road?

Why? Why?? Why???

-- Since it is such a self-sufficient community, you can build it anywhere ... most people who live there do not need to commute to their work. And for those who need, they will live wherever the commute is acceptable for them.

-- It is an oxymoron to want to put a self-sufficient complex in the middle of an already congested area as is the case with San Antonio Road.

-- If your complex has shops that people ALREADY living around San Antonio want to visit, they will happily find a way to get there even if you are 30 miles away.

That is what people already do -- they visit Gilroy outlet shops for example.

-- Also, the movie theater on Shoreline Blvd is good enough -- we don't need one here in this congested space on San Antonio Road.

-- High Density developments are a bad idea when implemented inside a small narrow areas. This is no way to build a brand for a developer or for a city.

(1)

All you have to do is to JUST imagine these Phase-2 mammoth structures put in that pocket surrounded by San Antonio Road, Panchetti way, California Ave and the Phase-1 related 330-apartment complex.

This is NIGHTMARE on San Antonio Road. It would be appropriate to call Phase-1 as NIGHTMARE-1 and Phase-2 as the sequel NIGHTMARE-2.

(2)

The moment you imagine this nightmare, you will see for yourself the unviability of this unreasonable high-density development being inflicted on the surrounding neighborhood.

Whoever came up with this high-density concept did not think through all the consequences such as traffic issues, unsuitability of these structures for the neighborhood, etc. They were probably only focusing on the profitability of the high-density development.

(3)

Wait for Phase-1 to complete, let the neighborhood live through a fully occupied phase-1, go through a complete cycle of Thanksgiving, Christmas and NewYear. Prove to the existing neighborhood that Phase-1 is not a traffic menace and that folks already living in this neighborhood can commute to 101 via San Antonio Road.

(4)

Phase-2 should not even be on the agenda until Phase-1 has been completed and examined in the light of weekday traffic, holiday traffic, etc.

Why are we doing a Phase-2 meeting when we don't even have the complete picture of the impacts of Phase-1?

(5)

-- We have caltrain station and 101 access for the population already living in this neighborhood. These transport facilities are there for a reason.

-- You can't go wide-eyed about these transport facilities and use that as a reason to develop a massive business / residential /moviecomplex in the Phase-1/Phase-2 high-density development.

-- You will be creating a traffic mess for all the people already here, who need to drive to 101 (or caltrain station) without having to sit endlessly on the San Antonio traffic-lights (going towards north) starting from El Camino.

-- In fact the traffic mess on San Antonio Road is already unbearable even at the 20% Phase-1 occupancy. We don't need any STUDIES on traffic. I invite the city council to just watch the San Antonio Road traffic TODAY. You can SEE THE TRAFFIC YOURSELVES!!! You can STUDY the TRAFFIC yourselves without any expert's help!!!

(6)

San Antonio Road has other properties that need some development (I don't mean as horrendous density like Phase-1). If you allow all the development just with Phase-1 and Phase-2, it will not be fair to other land owners / developers that may want to develop on San Antonio Road.

Our assessment is that as of TODAY, San Antonio Road cannot handle anymore development. Adding anything more than one-story building in Phase-2 will be UNVIABLE.

(7)

We hope you have read through all our earlier emails and our points above.

We hope you will think through all the disadvantages of Phase-2 as it stands in the 30-page document and the meeting agenda above.

Please let this Phase-2 not become "NIGHTMARE-2 on San Antonio Road".

Thank you for your time.

Sincerely,

Gravely Concerned Residents

Appendix B

Air Quality and Greenhouse Gas Analysis Details

Air Quality and Greenhouse Gas Analysis Details

Appendix B-1. CalEEMod Inputs and Outputs for Construction

Appendix B-2. CalEEMod Inputs and Outputs for Operation

Appendix B-3. Health Risk Assessment and AERSCREEN Outputs

Appendix B-1

CalEEMod Inputs and Outputs for Construction

Mass Emissions Calculations

Construction activities associated with the project will generate short-term criteria pollutant (CP) and GHG emissions. CP emissions (ROG, NO_x, CO, PM10, and PM2.5) will originate from on-road hauling trips, worker commute trips, construction site fugitive dust, and off-road construction equipment. GHG emissions (CO₂, CH₄, and N₂O) from project construction would result from fuel usage by off-road construction equipment, on-road vehicles, and from electricity consumption during construction.

Construction-related emissions will vary substantially depending on the level of activity, specific equipment operations, and wind and precipitation conditions. Construction emissions are estimated based on the construction data provided by the applicant, which include schedules, phases, equipment list (types, quantities, and horsepower), equipment operation hours, and haul truck trips for demolished materials and excavated soil.

The CalEEMod (version 2013.2.2) emissions model was used to calculate exhaust emissions from heavy-duty construction equipment, on-road vehicles, and fugitive dust. Equipment types, quantities, horsepower, and daily operation hours for each construction phase are based on the applicant-provided construction data. Equipment load factors are based on CalEEMod default values. Construction activities and equipment operation are assumed to occur 5 days per week.

Project construction would require on-road vehicles for worker commute trips and hauling from demolition and site excavation/grading. Based on the locations of likely disposal sites, a trip length of 20 miles was assumed for truck hauling. Worker trip lengths were assumed to be 12.4 miles, based on CalEEMod default trips lengths for “home based work” trips in Santa Clara County.

Fugitive dust emissions generated by demolition, excavation, and grading were estimated based on the existing building area, project site acres, and the quantities of demolished debris and exported soil. Note that the estimated onsite dust emissions account for the dust control measure of watering twice per day, which is required by the BAAQMD and included as a mitigation measure for the Project.

Project construction would require the uses of electricity throughout the construction period. The electricity provider for the project area is Pacific Gas & Electric (PG&E). Based on estimated usage provided by the applicant, GHG emissions associated with electricity consumption during construction are estimated using the CO₂ emission factor published by PG&E (2013) and CH₄ and N₂O emission factors published by the Environmental Protection Agency (EPA) (2012).

Schedule and Phasing

Construction of the Project is scheduled to commence July 2014 and end November 2016, lasting approximately 28 months. The construction would include four major construction activities and crews: demolition, excavation and grading, building construction, and site paving and utilities. Each

construction crew would continue work on various blocks within the project site according to schedule. Therefore, on any one day there could be different construction activities occurring at different areas with the site. For example, on a workday in August 2014, there could be building construction activity taking place in Block 3, while parking structure excavation occurs for Blocks 1 and 2. Table B.1-1 outlines the expected construction schedule, activities, and associated construction equipment lists. Because the construction activities would overlap during the entire construction period, the construction emissions analysis is evaluated for each construction year, which accounts for the overlapping construction activities that would occur during each year.

Table B.1-1. Construction Phases and Schedule

Activity	Expected Start Date	Expected End Date	Equipment List
Demolition	06/16/2014	06/27/2014	2 excavators
Parking structure excavation and site grading	06/30/2014	01/19/2015	1 blade, 5 skidloaders, 1 excavator, 1 compactor, 1 roller
Building construction	07/28/2014	07/18/2016	1 crane, 2 forklifts, 4 scissor lifts, 4 JLG lifts
Site paving and utilities (2015)	01/20/2015	05/28/2015	1 wacker, 2 excavators, 1 loader, 1 crew truck, 1 pickup truck.
Site paving and utilities (2016)	02/02/2016	10/28/2016	1 wacker, 2 excavators, 1 loader, 1 crew truck, 1 pickup truck.

Construction Schedule and Vehicle Trips

Activity	Total Acres	Net Exported Material (CY)	Imported	Total Truck Trips	Truck Trips per Day	Worker	Start Date	End Date	Days
			AC/AB ³ (tons)			Trips per Day			
Demolition ¹		16,934		266	27	38	2014/06/16	2014/06/27	10
Excavation/ Grading ^{1,2}	9.9	192,444		24,760	170	78	2014/06/30	2015/01/19	146
Building Construction					30	314	2014/07/28	2016/07/18	516
Paving/ Utilities (1)	3.5		7900	720	3	26	2015/01/20	2015/05/28	93
Paving/ Utilities (2)						26	2016/02/02	2016/10/28	194

Note:

1. Construction waste generated at the Project site would be diverted to recycle or salvage, meeting a goal of 50% reduction.
2. Include 12,444 CY of recycled material (1,130 truckloads) and 180,000 CY of excavated soil.
3. AV/AB = Asphalt Concrete and Aggregate Base

Construction Crew

Activity	Type of Diesel			
	Equipment	Quantity	HP	Hours per day
Demolition	Excavator	2	200	8
Mass Excavation/ Grading	Blade	1	180	8
	Skiploader	5	80	8
	Excavator	1	200	8
	Compactor	1	250	8
	Roller	1	140	8
Building Construction	Crane	1	180	8
	Forklift	2	99	8
	Scissor Lift	4	49	8

Paving/ Utilities	Wacker	1	8	6
	Excavator	2	159	6
	Loader	1	225	6
	Crew Truck	1	300	6
	Pickup Truck	1	200	6

Note: Based on applicant provided equipment types, quantity, horsepower, and daily operation hour.

**Mountain View San Antonio Ph2 Project
Construction Data for CalEEMod Modeling and Emission Calculation**

Electricity Usage

Emission Rate			
	CO2⁴	CH4⁵	N2O⁵
Emission Rate (lbs/MWh)	393	2.89E-02	6.17E-03
GWP	1	21	310

Note:

4. CO2 emission rate is based on the PG&E 2011 emission inventory, in the Additional Optional Information tab of the Electric Power Sector (EPS) Report spreadsheet of PG&E's TCR report. PG&E Greenhouse Gas Emission Factors: Guidance for PG&E Customers. April 2013. Available:

http://www.pge.com/includes/docs/pdfs/shared/environment/calculator/pge_ghg_emission_factor_info_sheet.pdf.

5. CH4 and N2O emission rates are based on the eGRID2012 Version 1.0 subregion GHG output emission rates for year 2009.

Available: <http://www.epa.gov/cleanenergy/energy-resources/egrid/index.html>.

GHG Emissions

Year	Total Emissions (MT/year)				Total Electricity Usage
	CO2	CH4	N2O	Total CO2e	
2014	0.214	0.00	0.00	0.22	1200
2015	0.321	0.00	0.00	0.32	1800
2016	0.071	0.00	0.00	0.07	400

Note:

Electricity usage is about 300-500 kWh per block per year (EIR Question 09-06-2013.pdf)

2014 usage is the sum of a half year usage for each block (June/July to December).

2015 usage is the sum of a half year usage for blocks 3, 5, and 6 and a full year usage for blocks 1, 2, and 4, according to schedule.

2016 usage is the sum of a half year usage for blocks 1 and 2.

Appendix B-2

CalEEMod Inputs and Outputs for Operation

Mass Emissions Calculations

Mobile and area sources, as well as onsite natural gas combustion, will generate long-term emissions of ROG, NO_x, CO, PM, CO₂, CH₄, and N₂O. GHG emissions will also be generated by energy and water consumption, wastewater and waste generation, and refrigeration and air conditioning units. A small amount of CO₂ will be sequestered by trees and vegetation planted on the Project site. This appendix discusses the methodology used to estimate operational emissions under both existing and Project conditions.

Mobile Sources

Primary mobile sources associated with existing and Project conditions include visitor trips, waste management trucks, delivery trucks, and employee trips. Criteria pollutant and GHG emissions are generated by these sources through fossil fuel combustion. Land use and trip generation information used in the analysis are based on data described in Section 2, *Project Description* and provided by the traffic engineers (Appendix J). Operational emissions generated by mobile sources were quantified using CalEEMod. It was assumed that the Project would include the following TDM measures, as described in Section 2, *Project Description*.

- Increase job density (248 jobs/acre).
- Increase diversity in travel modes.
- Increase transit accessibility (0.1 mile to nearest stop).
- Improved pedestrian network (Project site only).

Area Sources and Onsite Natural Gas Combustion

Area sources operating under both existing and Project conditions include landscaping equipment, consumer products (i.e., cleaners, personal care products), and periodic emissions from the reapplication of architectural coatings. Emissions generated by these area sources were estimated using CalEEMod default emission factors and land use assumptions. Note that use of low VOC paints was assumed in the emissions modeling for the proposed Project.

Onsite natural gas combustion for space and water heating represents another type of area source that would operate under both existing and Project conditions. All emissions were estimated using CalEEMod default natural gas emission factors.

Energy, Water, Wastewater, and Waste

GHG emissions associated with building energy and water consumption, as well as wastewater and waste generation were analyzed in the operational emissions assessment for both existing and Project conditions. Electricity use in buildings results in indirect emissions from the power plants that produce electricity. Likewise, indirect emissions are generated by energy used to transport,

treat, and pump water and wastewater to the Project site. Waste-related emissions are primarily CH₄, which is released over time as waste decomposes in area landfills.

GHG emissions generated by building energy and water consumption and wastewater and waste generation were estimated using CalEEMod. Model defaults based on land use characteristics were utilized for the Project analysis. It was assumed that the Project would include the following energy, water, and waste efficiency measures, as described in Section 2, *Project Description*.

- 15% exceedence of Title 24 Energy Standard.
- Use low intensity/energy efficient lighting (20% energy reduction).
- Use of energy efficient refrigerators, clothes washers, and dishwashers.
- Use of low-flow faucets, toilets, and showerheads.
- Use of a water-efficient irrigation system.
- Require tenants recycle waste (assume 25%, the same as existing).

Refrigeration and Air Conditioning Units

Refrigeration and air conditioning units are sources of hydrofluorocarbons (HFCs). HFCs are used as substitute refrigerants for chlorofluorocarbons (CFCs), which have been phased out of use under the Montreal Protocol. GHG emissions from refrigerants and air conditioning were calculated for the Project and existing land uses using recent studies of HFC sources and documented refrigerant types, GWPs, charge sizes, and leak rates (Intergovernmental Panel on Climate Change/Technology & Economic Assessment Panel 2005; World Bank 2007). Equation 2-1 was used to estimate annual HFCs emissions associated with refrigeration and air conditioning units.

$$\text{Equation 2-1} \quad \text{Emissions} = CS * LR * GWP * Conv * Units$$

Where

Emissions	=	Equipment emissions, metric tons CO ₂ e per year
CS	=	Charge size
LR	=	Leak rate
GWP	=	HFC global warming potential
Conv	=	Kilograms to metric tons, 1,000
Units	=	Number of units

Urban Forests and Sequestration

Urban forest refers to trees and other vegetation planted within developed areas, including residential trees, urban parks, and median trees. Unlike other sectors described above, urban forests are emissions sinks that actively sequester (i.e., remove) atmospheric CO₂. Forestry emission sinks under existing and Project conditions were estimated using CalEEMod. CO₂ sinks are calculated within CalEEMod assuming a 20-year growth period and are presented in total tons of CO₂ sequestered. Annual CO₂ emissions sequestered were calculated by dividing total CO₂ sequestered by 20.

Mountain View San Antonio Ph2 Project
Operation Emissions for Existing and Proposed Operations

Existing Daily

Represents emissions associated with existing commercial uses currently operating on the Project site.
 Emissions would cease with implementation of the Project.

Net GHG emission Increase per Service Population (SP) ⁵															3.5

BAAQMD Thresholds	10	10	-	-	-	15	-	-	10	-						4.6 per SP
--------------------------	-----------	-----------	----------	----------	----------	-----------	----------	----------	-----------	----------	--	--	--	--	--	-------------------

Notes:

- Area sources include landscaping equipment, off-gassing during the reapplication of architectural coatings, and consumer products.
- Consumer products ROG emissions for the Project are reduced by 48% from the emissions CalEEMod reports because CalEEMod assumes consumer products will be used in the parking garage. Consumer products will likely not be used in a parking structure, so these emissions were reduced based on the square footage of the parking garage.
- Energy Sources include natural gas use and electricity consumption
- Urban forestry sequester (i.e., remove) atmospheric CO2. Sequestered emissions are show as a negative value and subtracted from the emissions total.
- The Project buildout would have capacity of approximately 2,500 employees. The GHG emissions increase per SP was calculated by dividing net GHG emissions by the number of employees at buildout (8,840 MTCO2e per year/2,500 employees).

Proposed Operation Data for CalEEMod Modeling and Emission Calculation

Parameter	Client Provided	CalEEMod Input
<i>Applicant Proposed Green Building Practice & TDM⁶:</i>		
Traffic	Increase job density by 248 jobs/acre	Same as client provided
	Increase diversity	Same as client provided
	Close proximity to transit and bike routes	Increase transit accessibility (0.1 mile to nearest stop).
	Shuttles to public transit	Improved pedestrian network (Project site only).
Energy	Public transit subsidy or passes to be provided to tenants	Not modeled, reflected in the trip rates used in the traffic study.
	California Energy Code requirements would be exceeded by at least 15%	Exceed Title 24 by 15%.
	Low intensity/energy efficient lighting	Use of energy efficient appliances (clothwasher, dishwasher, and refrig) for hotel and restaurants)
Water	Installation of a photovoltaic (PV) array on the roof of the parking garage is anticipated to reduce electricity needs by 25–30 %	20% energy reduction in lighting
	Minimized water usage with low-flow lavatory faucets, water closets, and urinals.	7% sitewide electricity reduction based on the CalEEMod default electricity usage for each land use.
Solid Waste	Watered planted areas with an approved automatic underground irrigation system to make efficient use of water through conservation techniques	Install low-flow faucet, toilet, and shower.
	Tenants will be required to recycle waste	Use of water efficient irrigation systems.
		Assume solid waste recycling and composting rate of 25%, same as existing.

- Note:**
1. Net weekday daily trips are provided in the TIA report prepared by Fehr & Peers. The net trips subtract the passby internal, and TDM trips that would result from the proposed land uses. The net trips are modeled as primary trips as the passby internal, and TDM trips have be subtracted from the total trips.
 2. No daily trips are provided in the TIA. Daily trisp are assumed 10 times of PM peak hour trips.
 3. Average trip length is provided in the TIA report prepared by Fehr & Peers.
 4. Interior and exterior coating area is reduced to account for the use of contemporary materials and detailing such as curtain wall and glazing systems with high performance clear glass, precast concrete, stone, and architectural metal panels, as described in the Project Description.
 5. CO2 Intensity Factor is updated to 393 lb/MWh per PG&E 2011 emission inventory, in the Additional Optional Information tab of the Electric Power Sector (EPS) Report spreadsheet of PG&E’s TCR report. PG&E Greenhouse Gas Emission Factors: Guidance for PG&E Customers. April 2013. Available: http://www.pge.com/includes/docs/pdfs/shared/environment/calculator/pge_ghg_emission_factor_info_sheet.pdf.
 6. See Chapter 2, Project Description.
 7. Estimation including 4 levels of underground parking below Blocks 1 and 2 (110, 700 sf each level) and 6 levels of parking at Block 5 (59,400 each level).

Mountain View San Antonio Ph2 Project

1.3 User Entered Comments & Non-Default Data

Project Characteristics - CO2 Intensity Factor is updated to 393 lb/MW hr per PG&E 2011 emission factor reported in the EPS Report spreadsheet of PG&E's TCR report.

Land Use - 59.655 kSF of existing retails in the 9.9 acre lot.

Construction Phase - Construction emissions are not considered under operations.

Area Coating -

Energy Use - -

Land Use Change -

Sequestration -

Construction Off-road Equipment Mitigation -

Mobile Land Use Mitigation -

Area Mitigation -

Energy Mitigation -

Waste Mitigation - 25% of waste is recycled, per Village at San Antonio-DataNeeds.docx on 2013-08-20.

Operational Off-Road Equipment - -

Vehicle Trips - Trip length reduce to 6 miles/trip per TIA report. Use TIA provided 1644 daily trips as 100% primary trips.

SAP2 Existing Operation
Santa Clara County, Winter

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Strip Mall	59.66	1000sqft	9.90	59,655.00	43

1.2 Other Project Characteristics

Urbanization	Urban	Wind Speed (m/s)	2.2	Precipitation Freq (Days)	58
Climate Zone	4			Operational Year	2013
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	393	CH4 Intensity (lb/MWhr)	0.029	N2O Intensity (lb/MWhr)	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - CO2 Intensity Factor is updated to 393 lb/MWh per PG&E 2011 emission factor reported in the EPS Report spreadsheet of PG&E's TCR report.

Land Use - 59.655 kSF of existing retails in the 9.9 acre lot.

Construction Phase - Construction emissions are not considered under operations.

Area Coating -

Energy Use - -

Land Use Change -

Sequestration -

Construction Off-road Equipment Mitigation -

Mobile Land Use Mitigation -

Area Mitigation -

Energy Mitigation -

Waste Mitigation - 25% of waste is recycled, per Village at San Antonio-DataNeeds.docx on 2013-08-20.

Operational Off-Road Equipment - -

Vehicle Trips - Trip length reduce to 6 miles/trip per TIA report. Use TIA provided 1644 daily trips as 100% primary trips.

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Office Building	28.50	1000sqft	0.65	28,502.00	150
Office Park	392.85	1000sqft	2.95	392,853.00	2000
Enclosed Parking with Elevator	2,490.00	Space	2.00	800,000.00	0
Hotel	167.00	Room	1.65	142,084.00	80
Movie Theater (No Matinee)	1,710.00	Seat	0.60	67,280.00	20
Quality Restaurant	35.36	1000sqft	0.81	35,358.00	100
Strip Mall	54.19	1000sqft	1.24	54,186.00	150

1.2 Other Project Characteristics

Urbanization	Urban	Wind Speed (m/s)	2.2	Precipitation Freq (Days)	58
Climate Zone	4			Operational Year	2017
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	393	CH4 Intensity (lb/MWhr)	0.029	N2O Intensity (lb/MWhr)	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - CO2 Intensity Factor is updated to 393 lb/MWh per PG&E 2011 emission factor reported in the EPS Report spreadsheet of PG&E's TCR report.

Land Use - Lot acres are updated to add up to 9.9 acres. Population for office is assumed 2,000 and for other land uses are 500 to add up to 2,500 for the project.

Construction Phase - Construction emissions are not considered under operations.

Area Coating - Coating area is reduced to 20% of default to account for the use of contemporary materials, as described in the Project Description.

Energy Use - -

Sequestration -

Mobile Land Use Mitigation - Increase employees from 43 to 2,500 in the 9.9 acre site.

Mobile Commute Mitigation -

Area Mitigation -

Energy Mitigation - Exceed California Energy Code by at least 15%, assume 20% lighting energy reduction and the use of energy efficient appliances, and 9% electricity reduction from PV array, per Project Description.

Water Mitigation - Minimized water usage with low-flow faucets and urinals. Watered planted areas with an approved automatic underground irrigation system.

Waste Mitigation - Per Project description, tenants will be required to recycle waste. Assume 25% reduction.

Vehicle Trips - Trip length reduce to 6 miles/trip per TIA report. Use TIA provided net daily trips as 100% primary trips.

Quality Restaurant	35.36	1000sqft	0.81	35,358.00	100
Strip Mall	54.19	1000sqft	1.24	54,186.00	150

1.2 Other Project Characteristics

Urbanization	Urban	Wind Speed (m/s)	2.2	Precipitation Freq (Days)	58
Climate Zone	4			Operational Year	2017
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	393	CH4 Intensity (lb/MWhr)	0.029	N2O Intensity (lb/MWhr)	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - CO2 Intensity Facor is updated to 393 lb/MWh per PG&E 2011 emission factor reported in the EPS Report spreadsheet of PG&E's TCR report.

Land Use - Lot acres are updated to add up to 9.9 acres. Population for office is assumed 2,000 and for other land uses are 500 to add up to 2,500 for the project.

Construction Phase - Construction emissions are not considered under operations.

Area Coating - Coating area is reduced to 20% of default to account for the use of contemporary materials, as described in the Project Description.

Energy Use - -

Sequestration -

Mobile Land Use Mitigation - Increase employees from 43 to 2,500 in the 9.9 acre site.

Mobile Commute Mitigation -

Area Mitigation -

Energy Mitigation - Exceed California Energy Code by at least 15%, assume 20% lighting energy reduction and the use of energy efficient appliances, and 9% electricity reduction from PV array, per Project Description.

Water Mitigation - Minimized water usage with low-flow faucets and urinals. Watered planted areas with an approved automatic underground irrigation

Waste Mitigation - Per Project description, tenants will be required to recycle waste. Assume 25% reduction.

Vehicle Trips - Trip length reduce to 6 miles/trip per TIA report. Use TIA provided net daily trips as 100% primary trips.

Screening-Level Health Risk Assessment

Project-Level Assessment

Exposure to diesel particulate matter (DPM) was assessed by predicting health risks in terms of excess cancer risk, non-cancer hazard indexes, and elevated PM2.5 concentrations. Consistent with the BAAQMD's (2010 and 2012) *CEQA Guidelines and Recommended Methods for Screening and Modeling Local Risks and Hazards*, average hourly PM10 and PM2.5 exhaust emissions for each construction period were quantified by converting daily emissions estimated by CalEEMod (see Appendix B-1). The EPA's AERSCREEN model, which is the screening-level model for AERMOD, was then used to predict PM10 and PM2.5 hourly concentrations at sensitive land uses within 25 to 50,000 meters of the Project site. Worst-case wind angle and atmospheric stability classes were assumed.

Project-level cancer risk for each construction period was calculated consistent with BAAQMD's (2012) *Recommended Methods for Screening and Modeling Local Risks and Hazards*. Cancer risk occurs exclusively through the inhalation pathway and was calculated according to Equation 3-1.

$$\text{Equation 3-1} \quad \text{Risk} = \text{Cair} * (\text{EH} / \text{AH}) * (\text{EF} * \text{ED} / \text{AT}) * \text{DBR} * \text{Conv}_1 * \text{ASF} * \text{CF} * \text{Conv}_2$$

Where

- Risk = DPM cancer risk (per million)
- Cair = Concentration in the air ($\mu\text{g}/\text{m}^3$), annual average from AERSCREEN
- EH = Exposure hours/day
- AH = Hours per day, 24
- EF = Exposure frequency in days/year
- ED = Exposure duration in years
- AT = Average lift time (25,550 days or 70 years)
- DBR = Daily breathing rate (L/kg body weight-day), 302 for adult and 581 for child
- Conv₁ = Conversion factor, $([\text{mg}/\mu\text{g}] * [\text{m}^3/\text{L}])$, 1×10^6
- ASF = Average age sensitivity factor, 1.7 for resident, 3 for student, 1 for worker
- CF = Cancer potency factor $([\text{mg}/\text{kg}\text{-day}]^{-1})$, 1.1
- Conv₂ = Risk per million people, 1×10^6

Project-level increases in the non-cancer hazard index (HI) were estimated by dividing the average annual DPM concentration predicted by AERSCREEN by the DPM Chronic Reference Exposure Level (REL) of 5 (California Air Resources Board 2012). Project-level increases in annual PM2.5 concentrations were calculated according to Equation 3-2.

$$\text{Equation 3-2} \quad \text{Concentration} = \text{Cair} * \text{Conv}_1 * (\text{OH} / \text{AH}) * (\text{OD} / \text{AD})$$

Where

Concentration	=	Average annual PM2.5 concentration ($\mu\text{g}/\text{m}^3$)
Cair	=	Concentration in air ($\mu\text{g}/\text{m}^3$), annual hourly from AERSCREEN
Conv ₁	=	Hourly to annual concentration conversion factor, 0.1
OH	=	Source operating hours/day
AH	=	Hours per day, 24
OD	=	Source operating days/year
AD	=	Days per year, 365
ED	=	Exposure duration in years

Cumulative Assessment

The cumulative health risk assessment considers background sources within 1,000 feet of the Project site. Background stationary and highway sources within 1,000 feet of the Project site were identified using Google Earth map files provided by the BAAQMD. In addition to BAAQMD data, health risks associated with Caltrain locomotive and Santa Clara Valley Transportation Authority (VTA) bus activity at the Caltrain station were quantified using daily schedule information and emissions factors provided by the EPA (2009) for locomotives and EMFAC2011 for bus idling.

Health risks associated with Caltrain locomotives were quantified using daily schedule information and published emissions factors. DPM emissions generated by both locomotive movement and idling and train idling at the VTA facility were estimated according to the following methodology.

- Locomotive Idling:** Online Caltrain schedules indicate that trains stop at the San Antonio Caltrain Station 46 times per weekday, 32 times per Saturday, and 28 times per Sunday (Caltrain 2013). Train idling was translated to grams of PM10 using the default EPA emission factor of 0.17 grams per horsepower hour, assuming a calendar year 2014 fleet average emission rate for commuter/passenger trains. PM2.5 emissions were scaled from PM10 by 0.97 (EPA 2009). Locomotive activity was based on a 40-second idle time for each stop, a weighted average horsepower rating based on Caltrain's existing fleet (Caltrain 2013), and a 0.004 idling load factor based on EPA guidance (U.S. Environmental Protection Agency 2010). DPM emissions calculated for locomotive idling were converted to an emissions rate based on the daily idle time (1,840 seconds). The AERSCREEN model was then used to predict PM10 and PM2.5 hourly concentrations at sensitive land uses within 10 to 50,000 meters of the Project site. Cancer risk and increases in the non-cancer HI were calculated using the AERSCREEN outputs and equations 3-1 and 3-2 (see above).
- Locomotive Movement:** Caltrain schedules indicate that a maximum of 27,456 annual train trips are made along the Project Area (91 weekday; 36 Saturday; and 32 Sunday). Annual PM10 emissions associated with locomotives operating on a 1,000-foot segment near the Project site were quantified using the same EPA default emission factors and horsepower used for idling in conjunction with a movement load factor of 0.438 based on EPA guidance (EPA 2010). DPM emissions calculated for locomotive operation were converted to an emissions rate (grams per second) assuming an average train speed of 49.1 miles per hour along the 1,000 foot segment (average speed reported in the CEP EIR) (U.S. Environmental Protection Agency and Federal

Transit Administration 2009). The AERSCREEN model was then used to predict PM10 and PM2.5 hourly concentrations at sensitive land uses within 10 to 50,000 meters of the Project site. Cancer risk and increases in the non-cancer HI were calculated using the AERSCREEN outputs and equations 3-1 and 3-2 (see above).

Note that the calculations herein do not take into account potential future emission reductions associated with the Caltrain Electrification Program (CEP), which is anticipated to convert the majority of Caltrain locomotives from diesel to electric power in the coming decades.

- **Bus Idling:** Health risks associated with bus connections at the Caltrain station were estimated using daily schedule information, the California Air Resource Board's (ARB's) EMFAC2011 model, and the EPA's AERSCREEN. Online VTA bus schedules indicate that Routes 32, 34, and 35 make routine connections at the Caltrain station. Collectively, these routes make a total of 116 stops at the facility on an average weekday, 43 stops on an average Saturday, and 23 stops on an average Sunday (Santa Clara Valley Transportation Authority 2013). Based on the existing VTA fleet, it was conservatively assumed that all buses would be diesel powered and would idle for an average of 1 minute per stop (Santa Clara Valley Transportation Authority 2010). Since 116 daily stops are made at the Caltrain station, on the maximum day this equates to a 110 vehicle-idle minutes per day. DPM emissions generated by vehicle idling were estimated using EMFAC2011. The AERSCREEN model was then used to predict PM10 and PM2.5 hourly concentrations at the Project site based on the maximum daily idling emissions estimated for the bus stops. Cancer risk and increases in the non-cancer HI were calculated using the AERSCREEN outputs and equations 3-1 and 3-2 (see above).

 ***** AERSCREEN MAXIMUM IMPACT SUMMARY *****

3-hour, 8-hour, and 24-hour scaled
 concentrations are equal to the 1-hour concentration as referenced in
 SCREENING PROCEDURES FOR ESTIMATING THE AIR QUALITY
 IMPACT OF STATIONARY SOURCES, REVISED (Section 4.5.4)
 Report number EPA-454/R-92-019
http://www.epa.gov/scram001/guidance_permit.htm
 under Screening Guidance

CALCULATION PROCEDURE	MAXIMUM 1-HOUR CONC (ug/m3)	SCALED 3-HOUR CONC (ug/m3)	SCALED 8-HOUR CONC (ug/m3)	SCALED 24-HOUR CONC (ug/m3)	SCALED ANNUAL CONC (ug/m3)
FLAT TERRAIN	45.36	45.36	45.36	45.36	N/A
DISTANCE FROM SOURCE	76.00 meters				
IMPACT AT THE AMBIENT BOUNDARY	28.90	28.90	28.90	28.90	N/A
DISTANCE FROM SOURCE	1.00 meters				

AERSCREEN RUN FOR TRAIN IDLING

TITLE: Caltrain IDLE

***** STACK PARAMETERS *****

SOURCE EMISSION RATE: 0.364E-05 g/s 0.289E-04 lb/hr
 STACK HEIGHT: 4.52 meters 14.83 feet
 STACK INNER DIAMETER: 0.620 meters 24.41 inches
 PLUME EXIT TEMPERATURE: 373.2 K 212.1 Deg F
 PLUME EXIT VELOCITY: 5.480 m/s 17.98 ft/s
 STACK AIR FLOW RATE: 3506 ACFM
 RURAL OR URBAN: URBAN
 POPULATION: 75232

INITIAL PROBE DISTANCE = 5000. meters 16404. feet

Suite 260
San Diego, CA 92130

Dear Mr. Geiser,

RE: SAN ANTONIO CENTER II, MOUNTAIN VIEW – HERITAGE TREE REPORT

The enclosed report discusses only heritage trees at the above-referenced site. These are trees that have a circumference of 48 inches (15.3 inches in diameter), or a combined diameter of multi-stemmed trees, at 54 inches above existing grade.

Tree numbers and circumferences were taken off the site plan as were tree names. Tree condition is a combination of general tree health and structure with general comments given for each tree. These trees were then appraised per Council of Tree & Landscape Appraisers, *Guide for Plant Appraisal*, 9th ed. Champaign, IL: International Society of Arboriculture, 2000. Using Carlson, R.E. (2000). *Tree Tracker, Tree inventory and Appraisal Software for Arborists*. (Version 3.33).

My report containing the information, appraisals, and tree protection measures is enclosed.

Please call with any questions regarding the report. I think this report is accurate and based on sound arboricultural principles and practices.

Sincerely,

Richard L. Huntington
Certified Arborist WE #0119A
Certified Forester #1925

October 15, 2013

Site:

The project is located along California Street at San Antonio Road in Mountain View. The site is an existing commercial parking lot for Ross Dress for Less™ and BevMo! All trees are in smaller sites surrounded by paving at various distances.

There are 75 total trees on this site. Their species are 25 *Jacaranda mimosifolia*; 27 *Platanus x acerifolia*; 11 *Liquidambar styraciflua*, 9 *Cinnamomum camphora*, 2 *Eucalyptus sp.*, and 1 *Podocarpus gracilior*. Fifteen (15) trees are basically street trees.

Of the 75 trees, only 7 are considered heritage trees. Though I inspected 75 trees, appraisals are for the 7 heritage trees.

Report:

This report includes only the 7 heritage trees. All trees were assigned a number; the heritage trees being numbered 14, 17, 19, 44, 53, 73, and 75.

Tree appraisals start with basic values based on tree species and circumference at 54 inches above natural grade. Then deductions are made based on tree condition rating (a combination of present tree health and structure); location factor is based on the tree's contribution to the site; placement in the site in relation to utilities, structures, hardscape, etc. Finally, for most sites, it is good to have a tree there. See the attached appraisals. If there are multiple trunks, they are added together to get a single trunk number by using the circumference of the largest trunk plus one-half the circumferences of the remaining trunks. This gives a good representative number.

Conclusion:

I do not have a proposed construction site plan and, therefore, do not know which trees might be removed or not. Most of the trees are in parking lot strips or are surrounded by hardscape. If the paving and curbs are to be replaced, then tree impacts will occur.

Protecting the trees to remain should be done by erecting chain link fencing along the existing planting area edges. These areas need to be posted as off limits to all construction activity and materials. See the enclosed sheets.

The total appraised value of the 7 heritage trees is **\$30,560**.

Appendix:

THE TRUNK FORMULA METHOD FOR APPRAISING THE VALUE OF A TREE IN NORTHERN CALIFORNIA

Established by the International Society of Arboriculture

The appraisal of a tree is based on four factors: tree diameter in inches, measured at four and one-half feet, or 54 inches, above natural grade (also known as Diameter at Breast Height, or DBH); tree species, as compared to the ideal tree; tree condition; and tree location. Guidelines for these factors are provided in the publication: *A Guide for Plant Appraisal, 9th Edition, 2000*.

Included with your report are computer-generated summary printouts using *Tree Tracker, Tree Inventory and Appraisal Software for Arborists, 2000* by Russell E. Carlson, RCA, with all the necessary information to calculate the value of your tree(s). The following should help to make this information more clear. This method is for trees that are not replaceable with a similar size.

The basic value of a tree is a set value, based on the cross section in square inches figured from the DBH. This value is found by multiplying the basal square inches of the subject tree by the value per square inch of a 24-inch boxed specimen of like species. These figures will vary depending on whether the tree is more or less than 30 inches in diameter.

A 24-inch boxed specimen is the largest commonly available transplantable size, and its costs and cross sections were standardized for convenience. Since the basic value cross section is the difference between the tree being appraised and a 24-inch specimen, the average cost to purchase and plant the 24-inch specimen is added back before the species condition and location factors are used.

The species percent factor relates to how the tree compares to an ideal and perfect tree for this area. This percentage compares the relative benefits and drawbacks of the species. An example of a species that is ideal for the San Francisco Bay Area would be a Coast Redwood or a Coast Live Oak. Both are listed at 90 percent, plus or minus 10 percent. Species percentages are provided in the *Species Characteristics and Group Assignment*, a book published by the Western Chapter of the International Society of Arboriculture.

The Tree Condition percent is based on the presence of diseases, insects, structural problems, etc. Age is also taken into account. For instance, if the tree had a trunk disease or exhibited a lack of roots, it would be given a lower condition rating.

Tree location is based on the tree's contribution to the property. This includes, but is not limited to, shading, screening, sound and wind protection, proximity to walkways, driveways, etc. It is expressed as an average of percentages for the site, the contribution, and the placement of the tree.

Figuring these percentages into the formula results in the final appraised value of the tree(s).

Note: Remedial repairs and removal costs may add to the appraised loss.

Appraisals of tree and landscaped values cannot be out of line with the appraisal of property values and are generally considered to be 20 to 25 percent of the property values. Some of these have been factored into the basic value. The individual appraiser has to keep this in mind when figuring the appraisal.

MITIGATING MEASURES FOR CONSTRUCTION IMPACTS ON EXISTING TREES

SECTION I: INTRODUCTION

It is an established fact that construction around existing trees will impact the trees to some degree. The degree of impact is largely predicated on the condition of the tree(s) before the construction activity begins. It is therefore important to inspect all trees prior to any construction activity to develop a "Tree Protection Program" based on the species, size, condition, and expected impact. A Certified Arborist (International Society of Arboriculture) is suggested for this work. The local University of California Extension or County Farm Advisors Office has the names of local certified arborists.

SECTION II: SITE PREPARATION

All existing trees shall be fenced within, at, or outside the dripline (foliar spread) of the tree using the following formula: Five inches in distance from the trunk, for every inch in trunk diameter, measured 4.5 feet above the average ground level. Example: a 24-inch diameter tree would have a fence erected 10 feet from the base of the tree ($24 \times 5 = 120/12 = 10$). The fencing should not interfere with actual construction, but is intended to redirect unnecessary traffic, and to protect limbs and roots. No storage of materials, unnecessary trenching, grading, or compaction shall be allowed within the dripline of the trees. Local ordinances may have different tree protection formulae.

The fence should be a minimum of four feet high, made of pig wire, snow fence, or cyclone, with steel stakes or pipes as posts.

If the fence is within the dripline of the trees, the foliar fringe outside the fence shall be raised to offset the chance of limb breakage from construction equipment encroaching within the dripline.

All contractors, subcontractors, and other personnel shall be warned that encroachment within the fenced area is forbidden without the consent of the certified arborist on the job. This includes, but is not limited to, storage of lumber and other materials, disposed-of paints, solvents, or other noxious materials, parked cars, grading equipment, and other heavy equipment. The temporary fence shall be maintained until the landscape contractor enters the job and commences landscape construction.

SECTION III: GRADING/EXCAVATING

All grading plans that specify grading within the dripline of any tree or within the distance from the trunk as outlined in SECTION II when said distance is outside the dripline, shall first be reviewed by the certified arborist. The arborist shall outline provisions for aeration, drainage, pruning, tunneling beneath roots, root pruning, or other necessary actions to protect the trees.

If trenching is necessary within the area, as described above, said trenching shall be undertaken by hand labor. All roots 2 inches or larger shall be tunneled and smaller roots shall be cut smoothly to the side of the trench. The side of the trench should be draped immediately with two layers of untreated burlap to a depth of 3 feet from the surface. The burlap shall be soaked nightly and left in place until the trench is backfilled to the original level. The arborist shall examine the trench prior to backfilling to ascertain the number and size of roots cut, and to suggest further remedial repairs.

SECTION IV: REMEDIAL REPAIRS, PENALTIES

The arborist on the job shall have the responsibility of observing all ongoing activities that may affect the trees, and prescribing necessary remedial work to insure the health and stability of said trees. This includes, but is not limited to, all arborist activities specified in SECTIONS I, II, and III. In addition, pruning, as outlined in the "Pruning Standards" of the Western Chapter of the International Society of Arboriculture, shall be prescribed as necessary. Fertilizing, mulching, aeration, irrigation, drainage, pest control, and other activities shall be prescribed according to the tree needs, local site requirements, and State Agricultural Pest Control Laws. All specifications shall be in writing. For a list of licensed pest control operators or advisors, consult the local County Agricultural Commissioner's Office.

Penalties, based on the cost of remedial repairs and the appraised values provided in the Evaluation Guide published by the International Society of Arboriculture, shall be assessed for damages to the trees.

SECTION V: FINAL INSPECTION

Upon completion of the project, the arborist shall review all work undertaken that impacted the existing trees. Special attention shall be given to cuts and fills, compaction, drainage, pruning, and future remedial work. The arborist should submit a final report in writing outlining the ongoing remedial care following the final inspection.

Protecting Trees From Construction Impacts

Sherburn R. Sanborn

Forester, Forest Pest Management Program, P.O. Box 820, Santa Rosa, CA 95402-0820

Why Should We Protect Trees

An important benefit of trees to society is their aesthetic value. Our parks, streets, homes and businesses would seem sterile without them. Trees also have monetary value. Residential and commercial properties with established trees have a greater market value than those without them. Trees provide other benefits which include: shade, noise abatement, wind breaks, erosion control and air pollution reduction. Like all green plants, trees convert carbon dioxide into oxygen during photosynthesis. This process contributes significantly to the recycling of the atmospheric gases we breathe. Unfortunately trees are often irreversibly damaged or killed during construction and/or landscaping.

Understanding a Tree's Root System

The primary impact of construction around a tree is to the unseen portion, the root system. Activities which disturb or alter the soil in which roots grow can injure or kill a tree. To reduce or prevent adverse impacts, we must understand how roots function and how they develop in the soil.

The greatest proportion (90%) of tree roots is found within the first three feet of soil. Roots function to support and anchor the tree. In addition, specialized (absorbing) roots function to exchange gases and to absorb water and minerals. Most absorbing roots are found in the first 8-12 inches of soil where water and oxygen can readily penetrate. Roots require both water and oxygen to grow and function. A network of supporting roots and absorbing roots grows well beyond the trunk. Depending on soil conditions they may extend two to three times the radius of the crown.

The roots of most tree species are associated with beneficial fungi called mycorrhizae. These fungi increase the roots ability to absorb water and minerals. Soil disturbance during construction can permanently disrupt this association.

How Construction Affects Roots

By understanding where roots grow and how they function, we can begin to see how construction activities such as trenching, slope cuts soil compaction, soil grade changes and paving can affect roots.

When trenching for utilities and foundations or where grade lowering is done close to a tree, there is a likelihood that roots will be cut. The closer the trench is to the trunk the greater the damage. Each root that is cut reduces the tree's capacity to supply water and nutrients to the leaves. Trenching within just a few feet of a trunk can reduce the functional root system by as much as 50%.

Soil is compacted during construction by heavy equipment which squeezes out the air spaces making it more dense and stable. Unfortunately, this process greatly reduces the infiltration of water and oxygen into the soil. As a result roots cease to function and eventually die. In addition, root penetration is decreased.

Soil grade changes alter the natural soil level around a tree. The addition of fill soil in particular, can have an effect similar to soil compaction. The depth and porosity of the fill soil are the most important factors affecting the tree. If the depth is significant or the porosity is low, root death can occur. For some tree species, a grade change of two inches can be significant. Soil fill that is compacted or has lower porosity than the native soil will restrict root activity.

If roots cannot develop or grow into the fill, recovery by the tree after construction may be impaired or prevented.

Fill soil around the root collar (the flared part of the trunk at or just above soil grade) and trunk will result in death and decay of the bark tissue. This can cause the death of all or part of the root system including the supporting roots. Often this results in a "Hazardous" tree.

Grade changes that require the removal of soil often remove absorbing roots and expose and injure other roots.

Concrete or asphalt paved over soil where roots are present will seal the surface, reducing water availability and gas exchange to the roots beneath. Usually soils are compacted prior to installing pavement which compounds these problems.

Symptoms Of Construction Impacts

An injured tree may take several months to many years to exhibit symptoms of construction impacts. These can include: slow decline, insect or disease attack, sparse foliage, significant branch dieback and wilting or yellowing of leaves.

Reducing Construction Impacts

The following techniques can be used to prevent or reduce the impacts of construction on trees:

- » Fence around the area within the dripline to protect it from construction activities. Because roots often grow beyond the dripline, enclosing a larger area is desirable.
- » Dig trenches by hand or tunnel under the tree if underground utilities must be installed within the tree's drip line.
- » Prune roots that must be removed, do not rip them out with a trencher or back hoe.
- » Bridge over roots when trenches for new foundations will damage them.
- » Construct wells around trunks and root collars to keep soil away and install aeration systems when the soil grade must be raised. Use a coarser fill soil than the soil being covered and do not compact. Add fill in the late fall or winter when roots are less active. Avoid working on wet soils.

What To Do After The Damage Is Done

- » Soil aeration (vertical or hydrojet mulching) can be effective where soils have been compacted.
- » Only remove dead, hazardous or obstructive branches. Never remove more than 20% of the foliage during a single year. Leaves produce carbohydrates and buds produce hormones - both are necessary for root growth.
- » Where appropriate, apply pesticides to reduce attacks by insects or other pests until the tree's vigor is restored.
- » Place organic mulch over bare soil.
- » Restore soil grade by removing fill.
- » Restore irrigation regime that existed before construction took place.

Summary

Construction around trees can be done successfully. However, this requires planning before construction or landscaping. Not all trees on a site are worth saving. Each tree should be evaluated by a consulting arborist to determine its condition and value in the landscape. It may be more desirable in the long run to plant new trees after construction is completed. The value of a tree should be used as a guide to determining the measures used to save it from construction impacts. Where trees of high value are present the effort and expense to save them is worthwhile. Mature trees take years to grow and their beauty and aesthetics are irreplaceable.

WHY IS IT IMPORTANT TO PROTECT TREES

BRANCH DAMAGE ALLOWS:

- Insects/Decay
- Improper wound closure

BARK DAMAGE

- Allows Insects/Decay
- Reduces water and nutrient uptake

ROOT DAMAGE FROM COMPACTION AND BREAKAGE:

- Prevents proper air/gas exchange
- Prevents proper callous formation
- Reduces water and nutrition uptake
- Can create a hazard tree

HOW TO PROTECT EXISTING VEGETATION

- CONSULT a professional arborist/forester.
- MODIFY site plans. Work around desirable trees/shrubs.
- REMOVE trees that are declining or will become a hazard.
- AVOID damage to existing vegetation by developing construction plans that address:
 1. where to pile dirt,
 2. RESTRICTION ZONES to prevent construction traffic from entering,
 3. outline specific techniques for tree felling, bulldozing, storage of materials, etc.

PROTECT THE CROWN, TRUNK, AND ROOTS FROM DAMAGE.

- BUFFER ZONES between trees and buildings help to protect them from construction and future building maintenance.
- AVOID disturbing the soil grade.
- PRUNE any large roots removed, DO NOT tear them out.
- TUNNEL under roots instead of trenching.
- ALLOW for watering of trees and shrubs during construction.

- DO NOT dispose of chemicals in the construction area.

EMPHASIZE ROOT PROTECTION

PREVENT SOIL COMPACTION

DO NOT TRENCH THROUGH ROOTS.

- What's below the ground is as important as what's above the ground.

Proposed Species

Amphibians

Rana draytonii

Critical habitat, California red-legged frog (PX)

Key:

(E) *Endangered* - Listed as being in danger of extinction.

(T) *Threatened* - Listed as likely to become endangered within the foreseeable future.

(P) *Proposed* - Officially proposed in the Federal Register for listing as endangered or threatened.

(NMFS) Species under the Jurisdiction of the [National Oceanic & Atmospheric Administration Fisheries Service](#). Consult with them directly about these species.

Critical Habitat - Area essential to the conservation of a species.

(PX) *Proposed Critical Habitat* - The species is already listed. Critical habitat is being proposed for it.

(C) *Candidate* - Candidate to become a proposed species.

(V) *Vacated* by a court order. Not currently in effect. Being reviewed by the Service.

(X) *Critical Habitat* designated for this species

Important Information About Your Species List

How We Make Species Lists

We store information about endangered and threatened species lists by U.S. Geological Survey 7½ minute quads. The United States is divided into these quads, which are about the size of San Francisco.

The animals on your species list are ones that occur within, **or may be affected by** projects within, the quads covered by the list.

- Fish and other aquatic species appear on your list if they are in the same watershed as your quad or if water use in your quad might affect them.
- Amphibians will be on the list for a quad or county if pesticides applied in that area may be carried to their habitat by air currents.
- Birds are shown regardless of whether they are resident or migratory. Relevant birds on the county list should be considered regardless of whether they appear on a quad list.

Plants

Any plants on your list are ones that have actually been observed in the area covered by the list. Plants may exist in an area without ever having been detected there. You can find out what's in the surrounding quads through the California Native Plant Society's online [Inventory of Rare and Endangered Plants](#).

Surveying

Some of the species on your list may not be affected by your project. A trained biologist and/or botanist, familiar with the habitat requirements of the species on your list, should determine whether they or habitats suitable for them may be affected by your project. We recommend that your surveys include any proposed and candidate species on your list. See our [Protocol](#) and [Recovery Permits](#) pages.

For plant surveys, we recommend using the [Guidelines for Conducting and Reporting Botanical Inventories](#). The results of your surveys should be published in any environmental documents prepared for your project.

Your Responsibilities Under the Endangered Species Act

All animals identified as listed above are fully protected under the Endangered Species Act of 1973, as amended. Section 9 of the Act and its implementing regulations prohibit the take of

a federally listed wildlife species. Take is defined by the Act as "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect" any such animal.

Take may include significant habitat modification or degradation where it actually kills or injures wildlife by significantly impairing essential behavioral patterns, including breeding, feeding, or shelter (50 CFR §17.3).

Take incidental to an otherwise lawful activity may be authorized by one of two procedures:

- If a Federal agency is involved with the permitting, funding, or carrying out of a project that may result in take, then that agency must engage in a formal [consultation](#) with the Service.

During formal consultation, the Federal agency, the applicant and the Service work together to avoid or minimize the impact on listed species and their habitat. Such consultation would result in a biological opinion by the Service addressing the anticipated effect of the project on listed and proposed species. The opinion may authorize a limited level of incidental take.

- If no Federal agency is involved with the project, and federally listed species may be taken as part of the project, then you, the applicant, should apply for an incidental take permit. The Service may issue such a permit if you submit a satisfactory conservation plan for the species that would be affected by your project.

Should your survey determine that federally listed or proposed species occur in the area and are likely to be affected by the project, we recommend that you work with this office and the California Department of Fish and Game to develop a plan that minimizes the project's direct and indirect impacts to listed species and compensates for project-related loss of habitat. You should include the plan in any environmental documents you file.

Critical Habitat

When a species is listed as endangered or threatened, areas of habitat considered essential to its conservation may be designated as critical habitat. These areas may require special management considerations or protection. They provide needed space for growth and normal behavior; food, water, air, light, other nutritional or physiological requirements; cover or shelter; and sites for breeding, reproduction, rearing of offspring, germination or seed dispersal.

Although critical habitat may be designated on private or State lands, activities on these lands are not restricted unless there is Federal involvement in the activities or direct harm to listed wildlife.

If any species has proposed or designated critical habitat within a quad, there will be a separate line for this on the species list. Boundary descriptions of the critical habitat may be found in the Federal Register. The information is also reprinted in the Code of Federal Regulations (50 CFR 17.95). See our [Map Room](#) page.

Candidate Species

We recommend that you address impacts to candidate species. We put plants and animals on our candidate list when we have enough scientific information to eventually propose them for listing as threatened or endangered. By considering these species early in your planning process you may be able to avoid the problems that could develop if one of these candidates was listed before the end of your project.

Species of Concern

The Sacramento Fish & Wildlife Office no longer maintains a list of species of concern. However, various other agencies and organizations maintain lists of at-risk species. These lists provide essential information for land management planning and conservation efforts.

[More info](#)

Wetlands

If your project will impact wetlands, riparian habitat, or other jurisdictional waters as defined by section 404 of the Clean Water Act and/or section 10 of the Rivers and Harbors Act, you will need to obtain a permit from the U.S. Army Corps of Engineers. Impacts to wetland habitats require site specific mitigation and monitoring. For questions regarding wetlands, please contact Mark Littlefield of this office at (916) 414-6520' .

Updates

Our database is constantly updated as species are proposed, listed and delisted. If you address proposed and candidate species in your planning, this should not be a problem. However, we recommend that you get an updated list every 90 days. That would be January 20, 2014.

The property at 391 San Antonio Road in Mountain View consists of a one-story commercial building constructed in 1951 and significantly remodeled in the 1990s. It is rectangular shaped in plan with a projecting façade and a flat roof extension to the rear. The main projecting bay is clad in stucco siding and features a rounded parapet, semi-circular marquee, concrete columns, fixed metal-frame plate glass windows, metal-frame double-entry glass door and decorative diamond-shape tiles. Both portions of the building have been altered from their original design (see Continuation Sheet, Photo 2).

APN: 14822008

*P3a. **Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The property at 405 San Antonio Road in Mountain View consists of a one-story commercial retail strip building constructed in 1958 in the Commercial Modern style. The large central reinforced concrete building is capped by a flat roof and widely spaced stepped parapet. The storefronts are recessed beneath a covered concrete breezeway that is supported by thick concrete columns. Storefront entrances consist of metal-frame double-entry glass doors with metal-frame multi-pane lights and transoms. The façade is greatly altered. The breezeway, cornices, and fenestration all appear to be late-20th Century alterations to the 1958 building.

Project 731578603

Mr. Glenn Goodman
Merlone Geier
3580 Carmel Mountain Road, Suite 260
San Diego, California 92130

Subject: Geotechnical Investigation
The Village at San Antonio Center North
Mountain View, California

Dear Mr. Goodman:

We are pleased to present our geotechnical investigation report for The Village at San Antonio Center North development in Mountain View, California. This investigation was performed in accordance with our proposal dated 1 February 2013, with the exception that subsurface conditions for a portion of the site, Parcel 3, were not evaluated because access to Parcel 3 was not authorized at the time of our investigation. We previously provided preliminary geotechnical conclusions and recommendations for the project in a letter dated 8 February 2013.

The site is southeast of the intersection of California Street and San Antonio Road and is bound by San Antonio Road to the west, California Street to the north, Pacchetti Way to the east, and the Hetch Hetchy easement to the south. South of the Hetch Hetchy easement is the San Antonio Center (Phase 1), which is a retail development currently under construction. The proposed Phase 2 site has maximum plan dimensions of approximately 600 feet by 700 feet and is currently a shopping center. On the northern side of the site there are three existing buildings with mixed commercial and retail use (excluding the two existing buildings on Parcel 3), while the remainder of the site is covered by surface parking and landscape areas. On the southern side of the site, a building was recently demolished and this area is now being used as a construction staging area for the Phase 1 site.

We understand the existing buildings on the site will be demolished and removed. The proposed development will consist of five new buildings on different parcels as described below:

- **Parcels 1 and 2** – Mixed-use commercial and retail consisting of six-story buildings over three or four levels of below grade parking.
- **Parcel 4** – A hotel with retail at ground floor consisting of a six-story building constructed at grade.
- **Parcel 5** – A parking structure consisting of a seven-story structure over one basement level extending approximately 11 feet below existing grades.
- **Parcel 6** – A movie house (cinema) consisting of an approximately 65 foot tall (three-story) structure constructed at grade.

Subsurface information from our field investigation indicates the site is generally underlain by interbedded layers of stiff to hard clay with variable sand and gravel content, medium dense to very dense sand with variable clay, silt, and gravel content, and medium dense to very dense gravel with variable clay and sand content to the maximum depth explored of 101.5 feet below the existing ground

surface (bgs). Results of laboratory tests performed on near-surface samples from borings throughout the site indicate the near-surface clay is moderately to highly expansive. Where groundwater was measured during our investigation, it was encountered between depths of 12 feet and 17 feet bgs.

We conclude that from a geotechnical engineering standpoint, the site can be redeveloped as planned, provided the recommendations presented in this report are incorporated into the project plans and specifications and are implemented during construction. The primary geotechnical concerns for the project are the presence of moderately to highly expansive near-surface soil at the site, the potential for liquefaction and associated settlement on proposed improvements, excavations of about 11 feet to possibly 40 feet below existing grades, dewatering, and potential consolidation settlement of the clay beneath the site under new building loads. We conclude the planned buildings may be supported on spread footings or mat foundations provided the estimated static and dynamic settlements presented in the report are acceptable. If the estimated static and dynamic settlements are acceptable, the at-grade and 1-basement level structures be supported on mats or spread footings over improved soil.

This report presents our recommendations regarding site preparation, foundation design, basement wall design, pavement design, and other geotechnical aspects of the project. The recommendations are based on limited subsurface exploration and laboratory testing programs. Consequently, variations between expected and actual soil conditions may be found in localized areas during construction. Therefore, we should be engaged to observe subgrade preparation, check compaction of fill and backfill, and observe installation of temporary shoring and building foundations, during which time we may make changes in our recommendations, if deemed necessary.

We appreciate the opportunity provide our services to you on this project. If you have any questions, please call.

Sincerely yours,
TREADWELL & ROLLO, A LANGAN COMPANY

**GEOTECHNICAL INVESTIGATION
THE VILLAGE AT SAN ANTONIO CENTER NORTH
MOUNTAIN VIEW, CALIFORNIA**

1.0 INTRODUCTION

This report presents the results of the geotechnical investigation performed by Treadwell & Rollo for The Village at San Antonio Center North in Mountain View, California. This investigation was performed in accordance with our proposal dated 1 February 2013, with the exception that subsurface conditions for a portion of the site, Parcel 3, were not evaluated because access to Parcel 3 was not authorized at the time of our investigation. We previously provided preliminary geotechnical conclusions and recommendations for the project in a letter dated 8 February 2013.

The site is southeast of the intersection of California Street and San Antonio Road in Mountain View, California, as shown on Figure 1. It is bound by San Antonio Road to the west, California Street to the north, Pacchetti Way to the east, and the San Francisco Public Utilities Commission (SFPUC) Hetch Hetchy easement to the south. South of the Hetch Hetchy easement is the San Antonio Center (Phase 1), which is a retail and residential development currently under construction. The proposed Phase 2 site has maximum plan dimensions of approximately 600 feet by 700 feet and is currently a shopping center. On the northern side of the site there are three existing buildings with mixed commercial and retail use (excluding the two existing buildings on Parcel 3), while the remainder of the site is covered by surface parking and landscape areas. On the southern side of the site, a building was recently demolished and this area is now being used as a construction staging area for the Phase 1 construction. The ground surface at the site generally slopes up gently toward the south, from about Elevations 50 feet¹ along California Street to about 60 feet along the Hetch Hetchy easement.

¹ Elevations are based on North American Vertical Datum of 1988 (NAVD88).

We understand the existing buildings on the site will be demolished and removed. The proposed development will consist of five new buildings on different parcels as described below:

- **Parcels 1 and 2** – Mixed-use commercial and retail consisting of six-story buildings over three or four levels of below grade parking.
- **Parcel 4** – A hotel with retail at ground floor consisting of a six-story building constructed at grade.
- **Parcel 5** – A parking structure consisting of a seven-story structure over one basement level extending approximately 11 feet below existing grades.
- **Parcel 6** – A movie house (cinema) consisting of an approximately 65 foot tall (three-story) structure constructed at grade.

Based on information provided by the project structural engineer, Magnusson Klemencic Associates (MKA), we understand estimated dead plus live (D + L) interior column loads to be on the order of 700 kips for the cinema structure. According to Paradigm Structural Engineers, D + L interior column loads for the Parcel 4 hotel structure are also on the order of 700 kips.

2.0 SCOPE OF SERVICES

Our scope of services for our geotechnical investigation, outlined in our proposal dated 1 February 2013, consisted of exploring the subsurface conditions at the site and performing laboratory tests and engineering analyses to develop conclusions and recommendations regarding:

- soil and groundwater conditions at the site
- most appropriate foundation type(s) for the proposed structures
- estimates of total and differential settlement of new foundations under design loads
- basement/retaining wall design
- site grading and excavation, including criteria for fill quality and compaction
- flexible (asphalt concrete) pavement design
- concrete (rigid) and permeable pavement design, as required
- temporary slopes and shoring for the proposed excavations
- soil corrosivity considerations
- expansion potential of the near surface soil
- site seismicity

- geologic hazards and related ground deformation, including seismic hazards
- 2010 California Building Code (CBC) seismic design criteria
- construction considerations.

3.0 FIELD INVESTIGATION AND LABORATORY TESTING

3.1 Current Investigation

Subsurface conditions were explored at the site by drilling twelve borings, designated B-1, B-2, and B-5 through B-14 and performing eight cone penetration tests (CPTs) designated CPT-3 through CPT-10. Two additional borings, designated B-3 and B-4, and two additional CPTs, designated CPT-1 and CPT-2, were planned for Parcel 3; however, they were not performed because Parcel 3 was not accessible at the time of our investigation. The approximate locations of the borings and CPTs are presented on Figure 2. The borings were drilled on 11 through 22 February 2013 using a truck-mounted rotary wash drill rig, and were advanced to depths ranging from about 46.5 to 101.5 feet bgs. Prior to performing our field investigation we obtained drilling permits from the Santa Clara Valley Water District (SCVWD), notified Underground Service Alert, and retained a private underground utility locating service to check that locations of exploratory points were clear of existing utilities.

Pitcher Drilling of East Palo Alto, California drilled the borings under the direction of our field engineer, who logged the borings and obtained representative samples of the soil for laboratory testing purposes. The boring logs are presented in Appendix A on Figures A-1 through A-12. The soil encountered in the borings was classified in accordance with the soil classification system presented on Figure A-13.

Soil samples were obtained during drilling using the following sampler types:

- Standard Penetration Test (SPT) split-barrel sampler with a 2.0-inch-outside diameter and a 1.5-inch-inside diameter, without liners
- Sprague and Henwood (S&H) split-barrel sampler with a 3.0-inch-outside diameter and a 2.5-inch-inside diameter lined with brass or stainless steel tubes with an inside diameter of 2.43 inches
- Shelby Tube (ST) sampler with a 3.0-inch outside diameter and a 2.875-inch inside diameter
- Dames and Moore Piston Sampler (D&M) with a 2.5-inch outside diameter and a 2.43-inch inside diameter.

The sampler types were chosen on the basis of soil type being sampled and desired sample quality for laboratory testing. In general, the S&H sampler was used to obtain samples in medium stiff to very stiff cohesive soil and the SPT sampler was used to evaluate the relative density of sandy soil. The Shelby and Dames and Moore samplers were used to obtain relatively undisturbed samples of the soft to medium stiff cohesive soil.

The SPT and S&H samplers were driven with a 140-pound, above-ground, automatic safety hammer falling 30 inches. The samplers were driven up to 18 inches and the hammer blows required to drive the samplers every six inches of penetration were recorded and are presented on the boring logs. A "blow count" is defined as the number of hammer blows per six inches of penetration or 50 blows for six inches or less of penetration. The driving of samplers was discontinued if the observed (recorded) blow count was 50 for six inches or less of penetration. The blow counts required to drive the S&H and SPT samplers were converted to approximate SPT N-values using factors of 0.7 and 1.2, respectively, to account for sampler type and hammer energy and are shown on the boring logs. The blow counts used for this conversion were: 1) the last two blow counts if the sampler was driven more than 12 inches, 2) the last one blow count if the sampler was driven more than six inches but less than 12 inches, and 3) the only blow count if the sampler was driven six inches or less.

The Shelby Tube and Dames and Moore samplers are both pushed hydraulically into the soil; when available, the pressure required to advance the sampler is shown on the logs, measured in pounds per square inch (psi).

The CPTs were performed by hydraulically pushing a 1.4-inch-diameter, cone-tipped probe with a projected area of 10 square centimeters into the ground. The cone-tipped probe measures tip resistance, and the friction sleeve behind the cone tip measures frictional resistance. Electrical strain gauges within the cone continuously measure soil parameters for the entire depth advanced. Soil data, including tip resistance and frictional resistance, were recorded by a computer while the test was conducted. Accumulated data were processed by computer to provide engineering information such as the types and approximate strength characteristics of the soil encountered.

The CPTs were advanced by Middle Earth Geo Testing, Inc. of Fremont, California on 20 through 21 February 2013 to depths between about 45 and 100.5 feet bgs. The CPT logs present tip resistance and friction ratio by depth, as well as interpreted standard penetration test blow counts, soil shear strength parameters, and soil classifications. The logs of the CPTs performed during our investigation are presented in Appendix B.

Upon completion of the field investigation, the boreholes and CPTs were backfilled with cement grout in accordance with SCVWD requirements. Soil cuttings from the borings were placed into 55-gallon drums which were temporarily stored on-site, tested, and eventually transported off-site for proper disposal.

3.2 Laboratory Testing

We re-examined the soil samples obtained from our borings to confirm the field classifications and select representative samples for geotechnical laboratory testing. Soil samples were tested to measure moisture content, dry density, gradation, fines content, Atterberg limits, strength, resistance value (R-value), consolidation properties, and corrosion potential. The geotechnical laboratory test results are presented on the boring logs and/or in Appendix C.

3.3 Previous Investigations by Others

A previous geotechnical investigation was performed in the vicinity of the project site by Moore Twining Associates, Inc., the results of which were presented in a report dated 23 July 2010 (revised 12 May 2011). The approximate locations of the borings at or near the site by others are presented on Figure 2. The boring logs from these investigations are presented in Appendix D.

4.0 SUBSURFACE CONDITIONS

Subsurface information from our field investigation indicates the site is generally underlain by interbedded layers of stiff to hard clay with variable sand and gravel content, medium dense to very dense sand with variable clay, silt, and gravel content, and medium dense to very dense gravel with variable clay and sand content to the maximum depth explored of 101.5 feet bgs. Results of Atterberg limits tests performed on the near-surface clay indicate it has a moderate to high expansion potential.²

In several of the borings (B-1, B-2, B-5, B-6, and B-12 through B-14), one to four layers of medium stiff clay were encountered, each ranging from about 3 to 11 feet thick. The combined thickness of the medium stiff clay layers in each of these borings ranges from about 5 to 20 feet, with the layers occurring generally between depths of about 10 and 33 feet bgs. In Borings B-11 and B-13, three to four feet of medium stiff clay were encountered at depths of about 40 to 45 feet bgs, respectively (with the tops of the layers at about Elevation 12 feet and 16 feet in Borings B-11 and B-13, respectively). No medium

² Expansive soil undergoes large volume changes with changes in moisture content (i.e. it shrinks when dried and swells when wetted.)

stiff clay layers were encountered in Borings B-7 through B-10, or B-14. In each of the borings, except Borings B-1 and B-9, several layers of medium dense sand with variable clay, silt, and gravel content and gravel with variable sand and clay content were encountered; in general, each of these layers was less than 6 feet thick.

The soil types encountered in the CPTs were generally characterized as medium stiff to very stiff clay with interbedded layers of medium dense to very dense sand and gravel. Thin layers of medium stiff clay (generally about 1 to 5 feet thick) were encountered throughout the CPTs. The total thickness of medium stiff clay layers in the CPTs ranged from less than 2 feet thick in CPT-9 to about 17 feet thick in CPT-3. In CPT-3 through CPT-6, the medium stiff clay was generally encountered above a depth of 44 to 54 feet bgs (corresponding to approximate Elevations between about 0 and 8 feet). In CPT-7 through CPT-10, the medium stiff clay was above a depth of about 36 feet bgs (corresponding to approximate Elevation 17 feet). In each CPT, a layer of dense to very dense sand, generally up to about five feet thick but as much as about 10 feet thick, was encountered at depths of about 7 to 9 feet bgs; the bottom of the sand layer was generally above about Elevation 41 feet. Below a depth of about 20 feet bgs, dense to very dense sand layers generally as much as about 5 thick, but up to 20 feet thick, were encountered in each of the CPTs.

Where groundwater was measured during our investigation, it was encountered between depths of 12 and 17 feet bgs, corresponding to elevations of about 38.5 to 43 feet. The groundwater levels were measured in the CPTs by performing pore pressure dissipation tests. Where groundwater was measured in the borings, it was generally measured during drilling; these levels do not represent stabilized groundwater conditions. The groundwater in Borings B-7 and B-12 was allowed to stabilize overnight with water levels measured the following morning. The groundwater levels at the sites are expected to vary seasonally.

5.0 REGIONAL SEISMICITY

The major active faults in the area are the San Andreas, Hayward, Calaveras, and San Gregorio Faults. These and other faults of the region are shown on Figure 3. For each of the active faults within about 50 kilometers of the site, the distance from the site and estimated mean characteristic Moment

magnitude³ [2007 Working Group on California Earthquake Probabilities (WGCEP) (2008) and Cao et al. (2003)] are summarized in Table 1.

TABLE 1
Regional Faults and Seismicity

Fault Segment	Approximate Distance from Site (km)	Direction from Site	Mean Characteristic Moment Magnitude
Monte Vista-Shannon	5.5	Southwest	6.5
N. San Andreas - Peninsula	9.5	Southwest	7.2
N. San Andreas (1906 event)	9.5	Southwest	8.1
Total Hayward	21	Northeast	7.0
Total Hayward-Rodgers Creek	21	Northeast	7.3
Total Calaveras	27	East	7.0
N. San Andreas - Santa Cruz	27	Southeast	7.1
San Gregorio Connected	28	West	7.5
Zayante-Vergeles	37	Southeast	7.0
Mount Diablo Thrust	44	Northeast	6.7
Greenville Connected	49	East	7.0

Figure 3 also shows the earthquake epicenters for events with magnitude greater than 5.0 from January 1800 through December 2000. Since 1800, four major earthquakes have been recorded on the San Andreas Fault. In 1836 an earthquake with an estimated maximum intensity of VII on the Modified Mercalli (MM) scale (Figure 4) occurred east of Monterey Bay on the San Andreas Fault (Topozada and Borchardt 1998). The estimated Moment magnitude, M_w , for this earthquake is about 6.25. In 1838, an earthquake occurred with an estimated intensity of about VIII-IX (MM), corresponding to a M_w of about 7.5. The San Francisco Earthquake of 1906 caused the most significant damage in the history of the Bay Area in terms of loss of lives and property damage. This earthquake created a surface rupture along the San Andreas Fault from Shelter Cove to San Juan Bautista approximately 470 kilometers in length. It had a maximum intensity of XI (MM), a M_w of about 7.9, and was felt 560 kilometers away in Oregon,

³ Moment magnitude is an energy-based scale and provides a physically meaningful measure of the size of a faulting event. Moment magnitude is directly related to average slip and fault rupture area.

Nevada, and Los Angeles. The most recent earthquake to affect the Bay Area was the Loma Prieta Earthquake of 17 October 1989, in the Santa Cruz Mountains with a M_w of 6.9, approximately 46 km from the site.

In 1868 an earthquake with an estimated maximum intensity of X on the MM scale occurred on the southern segment (between San Leandro and Fremont) of the Hayward Fault. The estimated M_w for the earthquake is 7.0. In 1861, an earthquake of unknown magnitude (probably a M_w of about 6.5) was reported on the Calaveras Fault. The most recent significant earthquake on this fault was the 1984 Morgan Hill earthquake ($M_w = 6.2$).

The 2007 WGCEP at the U.S. Geologic Survey (USGS) predicted a 63 percent chance of a magnitude 6.7 or greater earthquake occurring in the San Francisco Bay Area in 30 years. More specific estimates of the probabilities for different faults in the Bay Area are presented in Table 2.

TABLE 2
WGCEP (2008) Estimates of 30-Year Probability
of a Magnitude 6.7 or Greater Earthquake

Fault	Probability (percent)
Hayward-Rodgers Creek	31
N. San Andreas	21
Calaveras	7
San Gregorio	6
Concord-Green Valley	3
Greenville	3
Mount Diablo Thrust	1

6.0 DISCUSSION AND CONCLUSIONS

We conclude that from a geotechnical engineering standpoint, the site can be developed as planned, provided the recommendations presented in this report are incorporated into the project plans and specifications and are implemented during construction. The primary geotechnical concerns for this site are:

- the potential for liquefaction and associated settlement on proposed improvements

- excavations between about 11 and 40 feet below existing grades
- dewatering
- potential consolidation settlement of the clay beneath the site, under new building loads

Our conclusions regarding seismic hazards, the most appropriate foundation type(s), settlement, and other geotechnical issues are presented in this section.

6.1 Seismic Hazards

During a major earthquake on one of the nearby faults, strong to very strong shaking is expected to occur at the site. Strong shaking during an earthquake can result in ground failure such as that associated with soil liquefaction,⁴ lateral spreading,⁵ and cyclic densification.⁶ We used the results of the borings and CPTs to evaluate the potential for these phenomena to occur at the site. The results of our evaluation are presented below.

6.1.1 Fault Rupture

Historically, ground surface displacements closely follow the trace of geologically young faults. The site is not within an Earthquake Fault Zone, as defined by the Alquist-Priolo Earthquake Fault Zoning Act, and no active or potentially active faults exist on the site. In a seismically active area, the remote possibility exists for future faulting in areas where no active faults previously existed; however, we conclude the risk of surface faulting and consequent secondary ground failure from unknown faults is low.

6.1.2 Soil Liquefaction and Associated Hazards

Liquefaction is a phenomenon in which saturated soil temporarily loses strength from the build-up of excess pore water pressure, especially during earthquake-induced cyclic loading. Flow failure, lateral spreading, differential settlement, loss of bearing strength, ground fissures, and sand boils are evidence

⁴ Liquefaction is a transformation of soil from a solid to a liquefied state during which saturated soil temporarily loses strength resulting from the buildup of excess pore water pressure, especially during earthquake-induced cyclic loading. Soil susceptible to liquefaction includes loose to medium dense sand and gravel, low-plasticity silt, and some low-plasticity clay deposits.

⁵ Lateral spreading is a phenomenon in which surficial soil displaces along a shear zone that has formed within an underlying liquefied layer. Upon reaching mobilization, the surficial blocks are transported downslope or in the direction of a free face by earthquake and gravitational forces.

⁶ Cyclic densification is a phenomenon in which non-saturated, cohesionless soil is compacted by earthquake vibrations, causing differential settlement.

of excess pore pressure generation and liquefaction. We evaluated the potential for liquefaction to occur at the site in accordance with Special Publication 117A, *Guidelines for Evaluating and Mitigating Seismic Hazards Zones in California*, dated 11 September 2008, as described below.

The level of ground shaking that may occur at the site during future earthquakes is uncertain because the location, recurrence interval, and magnitude of future earthquakes are not known. A peak ground acceleration (PGA) of 0.46 times gravity (0.46g) was used in our liquefaction analysis. This PGA was calculated using the procedures specified in Section 1613 of the 2009 International Building Code (IBC) for the Design Earthquake, using site class D. We assumed an earthquake magnitude of 8.1, which is the maximum Moment magnitude for the San Andreas Fault, located about 9.5 kilometers from the site as shown in Table 1. We used the groundwater levels measured in our CPTs and borings in our liquefaction analyses.

We used the results of the CPTs to evaluate liquefaction potential at the site. The liquefaction analyses using CPT data were performed in accordance with the methodology presented in the publication titled *Proceedings of the NCEER Workshop on Evaluation of Liquefaction Resistance of Soils*, prepared by the National Center for Earthquake Engineering Research (NCEER), dated 31 December 1997, and in Youd et al. (2001). The susceptibility of sand to liquefaction under seismic loading was evaluated in general accordance with the procedure presented by Seed and Idriss (1982). Our liquefaction analysis using the CPT data indicates that isolated, thin, and discontinuous layers of medium dense granular soil below the groundwater table in the CPTs are susceptible to liquefaction ($FS_{liq} < 1.3$) during the design-level earthquake, as defined by the 2009 IBC.

We estimated liquefaction-induced settlement using the procedure outlined in the NCEER report. The strain potential of any potentially liquefiable layers was estimated in accordance with the method developed by Tokimatsu and Seed (1984), which relates $(N_1)_{60,CS}$ values to strain potential. The CPT tip resistance $(q_{C1N})_{CS}$ was converted to an $(N_1)_{60,CS}$ value assuming the ratio $(q_{C1N})_{CS}/(N_1)_{60,CS}$ (blows/foot) is equal to five. This value is consistent with published values for clean sand. The estimated liquefaction-induced settlement at the CPT locations is summarized below in Table 3.

TABLE 3
Estimated Liquefaction-Induced Settlement at CPT Locations

CPT Location	Computed Liquefaction-Induced Settlement (inches)
CPT-3	N/A
CPT-4	0.1
CPT-5	0.1
CPT-6	N/A
CPT-7	0.2
CPT-8	0.1
CPT-9	0.4
CPT-10	N/A

Note: N/A – not applicable (no potentially-liquefiable layers encountered).

In addition, we evaluated the potential for liquefaction using the results of our borings. The results of our analyses indicated that thin layers of potentially liquefiable soil were encountered in Borings B-6 and B-11, with associated liquefaction-induced settlements of less than 1/4 inch.

Based on our liquefaction analyses using the borings and CPTs, we conclude that beneath the majority of the site liquefaction-induced total settlement will be less than about 1/4 inch. In the vicinity of CPT-9, we estimate liquefaction-induced settlement may be on the order of 1/2 inch. Because liquefaction will likely occur in isolated areas, differential settlement may be relatively abrupt; therefore, differential settlements on the order of 1/4 inch may occur over short distances over the majority of the site. In the vicinity of CPT-9, we estimate differential settlement on the order of 1/2 inch could occur over a distance of about 50 feet.

The potential for liquefaction-induced ground rupture and sand boils to occur at the site depends on the thickness of the liquefiable soil layer relative to the thickness of the overlying non-liquefiable material. Ishihara (1985) presented an empirical relationship that provides criteria that can be used to evaluate whether liquefaction-induced surface ruptures and sand boils would be expected to occur under a given level of shaking for a liquefiable layer overlain by a non-liquefiable surficial layer. The potentially

liquefiable soil layers encountered in the borings and CPTs are relatively thin and deep (generally less than five feet thick and below a depth of 15 feet bgs). Therefore, we conclude that the potential for surface manifestations of liquefaction to be low under the current site conditions.

6.1.3 Lateral Spreading

Lateral spreading occurs when a continuous layer of soil liquefies at depth and the soil layers above move toward an unsupported face, such as an open slope cut, or in the direction of a regional slope or gradient. The potential for lateral spreading to occur at a site is typically evaluated using an empirical relationship developed by Youd, Hansen, and Bartlett (2002). This relationship incorporates the thickness of the liquefiable layer, the fines content and mean grain-size diameter of the liquefiable soil, the relative density of the liquefiable soil, the magnitude and distance of the earthquake from the site, the slope of the ground surface, and boundary conditions (such as a free face or edge of shoreline), to estimate the horizontal ground movement. The potentially liquefiable layers encountered in the CPTs and borings are thin, isolated, and discontinuous. Therefore, we conclude the potential for lateral spreading beneath the site is low.

6.1.4 Cyclic Densification

Cyclic densification of non-saturated cohesionless soil (sand and silt above the groundwater table) caused by earthquake vibrations may result in settlement. About 2 to 4 feet of loose to medium dense sand with varying clay and gravel content were encountered above the groundwater level in Borings B-6 and B-11. We compute that shallow foundations and surface improvements bearing within these non-saturated granular layers may settle up to approximately 1/4 inch due to strong shaking from a large earthquake, with a possibility of abrupt differential settlements of up to 1/4 inch over short distances. However, the potentially densifiable soil is present within the proposed excavation depths and, therefore, will be removed from beneath the building. The estimated densification settlement could potentially occur where these soil layers remain outside of the building footprint (e.g. beneath exterior sidewalks).

6.2 Groundwater and Dewatering

Groundwater levels were measured during our field investigation at approximate Elevations 38.5 to 42 feet, and are expected to fluctuate seasonally. We conclude a design groundwater level corresponding to Elevation 43 feet should be used at the site.

We understand one basement level is planned at Parcel 5; we anticipate the excavation for the basement will be about 11 feet below existing grades. If the excavation will extend below the design groundwater level (Elevation 43 feet), dewatering will be needed. Even with active dewatering, wet, disturbed subgrade soil may require stabilization prior to placement of improvements. One method of stabilizing subgrade soil consists of overexcavating the disturbed material and replacing it with a lean concrete rat slab. Alternatively, the removed soil could be replaced by a layer of reinforcement geotextile and crushed rock.

At Parcels 1 and 2, we understand three or four levels of below-grade parking are planned; we anticipate an excavation on the order of 30 to 40 feet below existing site grades will be needed to construct the below-grade levels. The excavation will extend below the groundwater level, and temporary dewatering will be required during construction. Even with active dewatering, the soil at the base of the excavation will likely be near saturation, and may require stabilization using one of the methods previously described.

The selection and design of the dewatering system should be the responsibility of the contractor. However, we should check the design of the proposed dewatering system prior to installation. The contractor should be familiar with any permit requirements for the installation of the dewatering wells and for disposal of the groundwater.

An active dewatering system is recommended if shoring is to consist of soldier piles and lagging. The active dewatering system should be designed to maintain the groundwater at least three feet below the lowest level of the excavation until sufficient weight and/or tiedown capacity is available to resist the hydrostatic uplift forces on the bottom of the foundation. Variables which significantly influence the performance of the dewatering system and the quantity of water produced include the number of wells, the depth and positioning of the wells, the interval over which each well is screened, and the rate at which each well is pumped. Different combinations of these variables can be used to dewater the site.

Dewatering the site could result in subsidence of the surrounding area due to increases in effective stresses in the soil. Therefore, adjacent improvements should be monitored for vertical movement and groundwater levels outside the excavation should be monitored while dewatering is in progress. While it is considered unlikely, should excessive settlement or groundwater drawdown be measured, the contractor should be prepared to recharge the groundwater outside the excavation through recharge wells. A recharge program should be submitted as a contingency item to the dewatering plan.

6.3 Foundation Support

Moderately to highly expansive near-surface soil was encountered at the site. Expansive soil is subject to high volume changes during seasonal fluctuations in moisture content, which can cause cracking of foundations and floor slabs. The detrimental effects of near-surface expansive soil can be mitigated by moisture conditioning the expansive soil below slabs, placing non-expansive fill below slabs, supporting foundations below the zone of severe moisture change, and/or designing foundations to resist the movements associated with the volume changes. Because expansive soil is present, we conclude the foundations for the at-grade structures (i.e. no basements), including the buildings planned for Parcels 4 and 6, should be designed to reduce the potential for movement due to moisture change. Because the planned buildings at Parcels 1, 2, and 5 will have below-grade levels, we conclude the foundations will be supported below the zone of severe moisture change and will not be susceptible to the effects of volume changes.

If the foundation and building loads are not sufficient to resist the seismic uplift loads, tiedown anchors may be needed. If tiedown anchors are used, they should be installed after placing the mud slab/waterproofing (where used). Additional waterproofing around the anchor penetration may be required to fill any voids left by the drilling operation.

6.3.1 Parcels 1 and 2

Parcels 1 and 2 will consist of six-story structures over three or four levels of below-grade parking. The primary concern for these structures is the impact of hydrostatic groundwater pressures on the foundations and basement walls.

We anticipate the excavation for the basement level will be on the order of 30 to 40 feet below existing grades. At this depth, we anticipate medium stiff to very stiff clay with varying amounts of sand and gravel, medium dense to very dense sand with varying amounts of clay and gravel, and very dense gravel with varying amounts of clay and sand will be exposed. The soil at the foundation level has moderate to high strength and relatively low compressibility, especially in the recompression range after the relief of overburden due to excavation of soil above the foundation level. On the basis of our investigation, a design groundwater level at Elevation 43 feet should be used for design. We conclude a mat foundation would be the most appropriate for these structures. A mat foundation can be designed to resist hydrostatic uplift pressures associated with the design groundwater level and will facilitate the installation of waterproofing.

Initially, as the proposed basement area is being excavated, we expect the removal of soil and resultant pressure relief will cause the base of the excavation to rebound (rise), especially near the center of the excavation. After the new foundation is constructed and new building loads are applied, the pressures will once again increase and the clay layer will recompress. The settlement associated with this recompression could be on the order of 1 inch. We estimate post-construction differential settlement between columns may be on the order of ½ inch. In addition, liquefaction-induced settlement on the order of 1/4 inch, as discussed in Section 6.1.2, may occur beneath the building during a major earthquake.

6.3.2 Parcel 5

Parcel 5 will consist of a seven-story parking structure with one basement level. The excavation for the Parcel 5 basement level will be about 11 feet below existing grades. We anticipate this will be above the groundwater. At this depth, we anticipate medium stiff to stiff clay with varying amounts of sand and gravel and medium dense to dense sand with varying amounts of clay and gravel will be exposed. The soil at the foundation level has moderate strength and moderate compressibility. On the basis of our investigation, a design groundwater level at Elevation 43 feet should be used for design. Given the estimated column loads, we judge this structure may be supported on continuous, strip footings.

We estimate the settlement associated with recompression of the excavation bottom once construction is complete could be on the order of 1/2 to 3/4 inch. We estimate post-construction differential settlement between columns may be on the order of 1/4 to 1/2 inch. In addition, liquefaction-induced settlement of up to 1/2 inch, as discussed in Section 6.1.2, may occur beneath the building during a major earthquake. We estimate differential settlement between adjacent columns should not exceed 1/2 inch (including static and dynamic settlement). If these static and dynamic settlements are unacceptable, we conclude using a mat foundation or spread footings in combination with soil improvement system to transfer the building loads below the upper compressible and potentially liquefiable soil would be an appropriate foundation solution for this structure. More discussion regarding soil improvement is provided in Section 6.3.3.

6.3.3 Parcels 4 and 6

Parcel 4 will consist of a 6-story hotel constructed at-grade. Parcel 6 will consist of a 3-story cinema constructed at-grade. The primary concerns for these structures are allowable bearing pressure and associated settlement.

Based on our field investigation, we anticipate the soil exposed at the foundation level of the planned Parcel 4 and Parcel 6 buildings will generally consist of anticipate stiff to very stiff sandy clay with varying amounts of gravel and medium dense clayey sand with gravel. The soil at and below the foundation level has moderate strength and low to moderate compressibility. Given the estimated column loads, we judge these structures may be supported on individual spread footings and/or continuous strip footings.

We estimate the immediate and consolidation settlement of these structures could be on the order of $\frac{3}{4}$ inch. In addition, liquefaction-induced settlement of up to 1/2 inch, as discussed in Section 6.1.2, may occur beneath the building during a major earthquake. We estimate differential settlement between adjacent columns should not exceed 1/2 inch (including static and dynamic settlement). If these static and dynamic settlements are unacceptable, we conclude using a mat foundation or spread footings in combination with soil improvement system to transfer the building loads below the upper compressible and potentially liquefiable soil would be an appropriate foundation solution for this structure. Proper installation of soil improvement reduces the potential for foundation settlement and allows for higher allowable foundation bearing pressures.

If the estimated settlements are unacceptable, we conclude that the most practical and economical foundation type/soil improvement system for the proposed structures is a mat or spread footings supported by displacement rammed aggregate piers (RAPs) or controlled low-strength material (CLSM) columns. Displacement RAPs (also known as Impact RAPs or Impact Geopiers) and CLSM columns improve the existing soil by replacing a portion of it with compacted aggregate (gravel) and CLSM, respectively, and by densifying the soil in between the columns/RAPs. Note that non-displacement RAPs or traditional Geopiers are likely not an appropriate system for this site because the zone of soil improvement needs to extend below the groundwater table, which generally renders open shaft drilling impractical.

CLSM columns are constructed by drilling 18- to 36-inch-diameter shafts with an auger and then, as the auger is withdrawn, installing CLSM under pressure into the shaft. Because the CLSM is injected under pressure, the soil in between adjacent CLSM columns is displaced and densified. The displacement RAPs are installed in a similar fashion by drilling 18- to 36-inch-diameter shafts with an auger and then backfilling the shaft with compacted aggregate material while removing the auger. The depths of the displacement RAPs and CLSM columns are based on the targeted zone of soil improvement. The purpose

of the displacement RAPs and CLSM columns is to reduce settlement potential and increase allowable bearing capacities (thus reducing the footing size) by strengthening the soil matrix. RAPs and CLSM columns can also be designed to resist uplift loads.

Based on our experience with sites with similar soil conditions, we anticipate static settlement of a properly constructed mat or spread footings supported on displacement RAP- or CLSM column-improved soil will be limited to 1/2 inch or less under the building loads, with less than 1/2 inch of differential settlement between adjacent columns. The estimated static settlement should be confirmed by the RAP/CLSM column design-build contractor.

6.4 Temporary Cut Slopes and Shoring

We anticipate excavations approximately 11 to 40 feet deep may be needed to construct the below-grade levels at Parcels 1, 2, and 5. In addition, excavations will be required for building foundations and below-grade utilities. The soil to be excavated consists predominantly of clay, sand, and gravel, which can be excavated using conventional earth-moving equipment such as loaders and backhoes. Excavations that will be deeper than five feet and will be entered by workers should be shored or sloped in accordance with the Occupational Safety and Health Administration (OSHA) standards (29 CFR Part 1926).

Temporary shoring will be required where temporary slopes are not possible because of space constraints. The primary considerations related to the selection of the shoring systems are:

- Protection of surrounding improvements, including roadways, utilities and adjacent structures
- Presence of groundwater within the proposed excavation depths.

We conclude the excavations can be retained using a soldier-pile-and-lagging shoring system or a soil-cement/concrete diaphragm wall. We also considered the use of sheet pile shoring; however, it may be difficult to install sheet piles through the dense to very dense sand and gravel layers present at the site. Tiebacks and/or internal bracing will likely be required for excavations greater than about 10 to 15 feet.

A soldier-pile-and-lagging system usually consists of concrete encased steel H-beams placed in predrilled holes extending below the bottom of the excavation. Where sand or gravel with little or no cohesion is encountered during soldier pile installation, drilling of the shafts for the soldier piles will likely require casing and/or the use of drilling mud to prevent caving. After installation of the H-beams, wood lagging is placed between the piles as the excavation proceeds. If voids are created by caving and running sand during lagging installation, the voids should be backfilled immediately after placement of the lagging.

Concrete diaphragm walls are reinforced concrete walls constructed using a slurry trench method. The walls are constructed in sections, called panels. After the excavation reaches the design depth and the reinforcement cage is placed, the slurry is displaced by concrete that is poured through a tremie pipe. Diaphragm walls can be used as temporary shoring and permanent walls.

Soil-cement walls are installed by advancing hollow-stem augers and pumping cement slurry through the tips of the augers during auger withdrawal. The soil is mixed with the cement slurry in situ, forming continuous, overlapping, soil-cement columns or continuous walls. Steel beams are placed in the soil-cement columns to provide rigidity. Soil-cement walls are faster to install and less expensive than concrete-diaphragm walls; however, they are considered temporary; permanent walls are usually built in front of the soil-cement walls.

The contractor should be responsible for the construction and safety of temporary shoring, which should be designed by an experienced shoring designer. The design of the selected dewatering system should be provided to the shoring designer so that the temporary groundwater elevation can be incorporated into the shoring design. Encroachment permits may be required for tiebacks installed under public streets and adjacent properties.

A monitoring program should be established to evaluate the effects of the construction on the adjacent improvements. The contractor should install survey points to monitor the movement of shoring and settlement of adjacent structures, if any, during excavation. The monitoring should provide timely data which can be used to modify the shoring system if needed. In addition, geotechnical instrumentation including inclinometers and piezometers should be installed to monitor movement of the shoring system and the groundwater level during excavation and construction.

6.5 Corrosion Potential

We performed corrosivity tests on soil samples collected from Borings B-1 and B-7 at depths of 2 feet bgs and 11 feet bgs, respectively. The soil samples were tested in accordance with Caltrans and ASTM protocols by Environmental Technical Services (ETS) of Petaluma, California. The corrosivity test results are presented in Appendix C on Figure C-21.

6.6 Construction Considerations

We anticipate portions of the foundation subgrade will be wet, soft and easily remolded during construction. To facilitate mat and slab construction for the buildings with excavations that will be near or below groundwater (Parcels 1, 2, and 5), we recommend a one-foot thick working pad of drain rock ($\frac{1}{2}$ to $\frac{3}{4}$ inch gradation) be placed on the subgrade. Where the subgrade is disturbed during construction, the disturbed material should be removed and replaced with either crushed rock or lean concrete. Furthermore, to reduce mat subgrade disturbance, only light construction equipment should be used. Waterproofing material and a mud slab can be placed immediately following the placement of the rock if approved by the waterproofing consultant. Alternatively, if rock is not used, the waterproofing material may be placed directly on the approved subgrade, followed by the mud slab, and then the reinforcing steel and concrete for the mat. The waterproofing material should reduce the risk of groundwater penetrating through the floor. The mud slab should reduce the potential for disturbing the underlying subgrade and rock, and should help protect the waterproofing from damage during construction.

Weak soil or non-engineered fill encountered in the bottom of footing excavations or mat subgrade should be excavated and replaced with lean concrete. The bottoms and sides of the foundation excavations should be maintained in a moist condition until concrete is placed.

We should check the foundation subgrade prior to placement of the working pad or waterproofing. Foundation subgrades should be free of standing water, debris, and disturbed materials.

7.0 RECOMMENDATIONS

Our recommendations regarding design of foundations, below-grade walls, temporary shoring, pavement, and other geotechnical aspects of this project are presented in this section.

7.1 Earthwork

7.1.1 Site Preparation

Site preparation should include removal of all existing structures, foundations, slabs, pavements, and underground utilities within the footprint of the planned development. All areas to receive improvements should be stripped of vegetation and organic topsoil. Stripped materials should be removed from the site or stockpiled for later use in landscaped areas, if approved by the landscape architect. Underground

utilities should be removed to the service connections and properly capped or plugged with concrete. Where existing utility lines will not interfere with the planned construction, they may be abandoned in-place, provided the lines are filled with lean concrete or cement grout to the limits of the project. Voids resulting from demolition activities should be properly backfilled with engineered fill as described in Section 7.1.3.

From a geotechnical standpoint, concrete and asphalt generated by demolition may be crushed and reused providing it is free of organic material and rocks or lumps greater than three inches in greatest dimension. The acceptability of using crushed asphalt at the site should be verified by the architect. Where crushed asphalt pavement materials are used, particles between 1 and 3 inches in greatest dimension should comprise no more than 30 percent of the fill by weight.

7.1.2 Subgrade Preparation

Mat Foundations and Slab-on-Grade for Parcel 5

We conclude the mats and slab-on-grade for Parcel 5 (and underlying capillary break/vapor retarder or waterproofing) may bear on native soil. Although the excavations for Parcels 1 and 2 will be actively dewatered and Parcel 5 basement should be above the groundwater, the soil at basement subgrade level will likely be near saturation. We recommend a one-foot thick working pad of drain rock ($\frac{1}{2}$ to $\frac{3}{4}$ inch gradation) be placed on the subgrade. Where the subgrade is disturbed during construction, the disturbed material should be removed and replaced with crushed rock or lean concrete. To protect the subgrade, we recommend heavy construction equipment (such as scrapers) not be allowed within two feet of subgrade and that final excavation be made with an excavator equipped with a smooth bucket. The soil subgrade should be kept moist until it is covered with the drain rock working pad or other improvements.

Slab-on-Grade for Parcels 4 and 6

Because of the presence of moderately to highly expansive, near-surface soil, the slabs-on-grade for Parcels 4 and 6 should be underlain by at least 12 inches of select fill, Caltrans Class 2 aggregate base (AB), or lime-treated soil. Prior to placement of the select fill or aggregate base, the soil subgrade should

be should be scarified to a depth of at least 12 inches, moisture-conditioned to at least three percent above optimum moisture content, and compacted to between 88 and 92 percent relative compaction⁷.

Pavement Areas

In asphalt and concrete pavement areas, where on-site engineered or select fill is exposed at soil subgrade, the upper six inches should be moisture-conditioned to above optimum moisture content and compacted to at least 95 percent relative compaction to provide a smooth non-yielding surface.

If expansive native clay is at subgrade in pavement areas, the upper 12 inches should be moisture-conditioned to at least two percent over optimum moisture content and compacted to at least 90 percent relative compaction. Because of the presence of expansive soil, concrete pavement sections should be underlain by at least six inches of select fill.

Flatwork Areas

As a minimum preparation for exterior concrete flatwork, including patio slabs and sidewalks, the upper 12 inches of expansive native soil at subgrade should be moisture-conditioned to at least three percent above optimum moisture content and compacted to between 88 and 92 percent relative compaction.

If it is desirable to reduce the potential for differential movement and cracking, exterior concrete flatwork should be underlain by at least 12 inches of select fill, Caltrans Class 2 aggregate base (AB), or lime-treated soil. Prior to placement of the select fill or aggregate base, the soil subgrade should be scarified to a depth of at least 12 inches, moisture-conditioned to at least three percent above optimum moisture content, and compacted to between 88 and 92 percent relative compaction. Select fill and AB at subgrade in concrete flatwork areas should be moisture-conditioned to above optimum moisture content and compacted to at least 95 percent relative compaction.

As an alternative to importing select fill or AB, the upper 12 inches of soil beneath the concrete flatwork may be lime-treated. The purpose of the lime treatment is to reduce the expansion potential of the surface soil and provide a firm surface for construction of the slab. For lime treatment, the upper 12 inches of the flatwork subgrade should be treated in place with between four to eight percent dolomitic quicklime by dry weight of soil. A specialty subcontractor typically performs lime treatment, and we recommend this work be performed only by an experienced contractor. The contractor should

⁷ Relative compaction refers to the in-place dry density of soil expressed as a percentage of the maximum dry density of the same material, as determined by the ASTM D1557 laboratory compaction procedure.

determine the percent lime to be used. Prior to lime treatment, we recommend the site be graded to a level pad elevation and all below-grade obstructions be removed. The soil treated with lime should be mixed and compacted in one lift. The lime should be thoroughly blended with the soil and allowed to cure for 24 hours prior to compaction. The lime-treated soil should be moisture-conditioned to above optimum moisture content and compacted to at least 90 percent relative compaction. Lime-treated soil should not be placed in landscaping areas as it will inhibit growth of vegetation. It should be noted that disposal of lime-treated soil is typically expensive because of the high pH of the treated soil.

7.1.3 Fill Placement

We anticipate fill placement at the site will consist primarily of minor grading for building pads, and backfill for utility trenches and around basement and retaining walls. Because the on-site, near-surface soil is moderately to highly expansive, concrete flatwork should be underlain by at least 12 inches of select fill, lime-treated soil, or Caltrans Class 2 AB, as recommended in Section 7.1.2. Prior to placement of fill, the subgrade soil should be scarified, moisture-conditioned, and recompacted as recommended in Section 7.1.2.

If native expansive clay is to be used as general site fill, it should be moisture-conditioned to at least three percent above optimum moisture content, placed in horizontal lifts not exceeding eight inches in loose thickness, and compacted to between 88 and 92 percent relative compaction.

Select fill should consist of imported or on-site soil that is free of organic matter and hazardous material, contain no rocks or lumps larger than three inches in greatest dimension, have a liquid limit less than 40 and plasticity index less than 12, and be approved by the geotechnical engineer. In addition, select fill should contain at least 20 percent fines (particles passing the No. 200 sieve) to reduce the potential for surface water to infiltrate beneath slabs. Select fill should be placed in lifts not exceeding eight inches in loose thickness, moisture-conditioned to above optimum moisture content, and compacted to at least 90 percent relative compaction for fill thickness equal to or less than five feet and 95 percent relative compaction for fill thickness greater than five feet.

We should approve all sources of engineered fill at least three days before use at the site. The grading subcontractor should provide analytical test results or other suitable environmental documentation indicating the imported fill is free of hazardous materials at least three days before use at the site. If this data is not available, up to two weeks should be allowed to perform analytical testing on the proposed import material.

7.1.4 Utility Trenches

Excavations for utility trenches can be made with a backhoe. All trenches should conform to the current CAL-OSHA requirements for slopes, shoring, and other safety concerns.

To provide uniform support, pipes or conduits should be bedded on a minimum of four inches of sand or fine gravel. After the pipes and conduits are tested, inspected (if required), and approved, they should be covered to a depth of six inches with sand or fine gravel, which should be mechanically tamped. If groundwater is encountered during trench excavation, the gravel used as bedding and cover should be replaced with Caltrans Class 2 permeable material below the water level, or the open-graded gravel used as bedding and cover should be wrapped in filter fabric (Mirafi 140N or equivalent) to reduce the potential for infiltration of fines.

Backfill for utility trenches and other excavations is also considered fill and should be placed and compacted according to the recommendations previously presented. If imported clean sand or gravel (defined as soil with less than 10 percent fines) is used as backfill, it should be compacted to at least 95 percent relative compaction. Jetting of trench backfill should not be permitted. Special care should be taken when backfilling utility trenches in pavement areas. Poor compaction may cause excessive settlements, resulting in damage to the pavement section.

Where utility trenches backfilled with sand or gravel enter the building pads, an impermeable plug consisting of native clay or lean concrete, at least five feet in length, should be installed at the building line. Further, where sand- or gravel-backfilled trenches cross planter areas and pass below asphalt or concrete pavements, a similar plug should be placed at the edge of the pavement. The plug should extend from the bottom of the trench to the subgrade elevation. The purpose of these recommendations is to reduce the potential for water to become trapped in trenches beneath the building or pavements. This trapped water can cause heaving of soils beneath slabs and softening of subgrade soil beneath pavements.

7.2 Foundation Support

We recommend the proposed buildings for Parcels 1 and 2 be supported on mat foundations. Parcels 4, 5, and 6 may be supported on spread and/or continuous strip footings. For these structures, if the static settlements discussed in Sections 6.3.2 or 6.3.3 are unacceptable, the soil beneath the foundation subgrade can be improved to reduce the potential for foundation settlement and allow for use of higher

allowable foundation bearing pressures or a mat foundation may be used. Because of the presence of near-surface moderately to highly expansive soil, select fill should be placed beneath the slab-on-grade and the foundations should be deepened to extend below the zone of severe moisture change for the at-grade structures at Parcels 4 and 6.

7.2.1 Mat Foundations

Provided the anticipated settlements are acceptable, the buildings at Parcels 1 and 2 should be supported on mats bearing on native, undisturbed soil.

We expect the average bearing pressure of the mats for each building will be low (about 1,700 pounds per square foot (psf), based on estimated column loads and an assumed column spacing of 30 feet); however, concentrated stresses may occur at interior columns and at the edges of the mat. The mat foundations may be designed to impose a maximum dead plus live load pressure under columns and walls equivalent to an allowable bearing pressure of 9,000 psf for the Parcels 1 and 2 buildings.

The allowable bearing pressure can be increased by one-third for total design loads, including wind and seismic loads. The allowable bearing pressure for dead plus live and total design loads include factors of safety of about 2.0 and 1.5, respectively. During a seismic event, these pressures may be exceeded under portions of the mat, and we should review the predicted stress distributions when available. Because the mats for the buildings at Parcels 1 and 2 will be below the design groundwater level, they should be designed to resist hydrostatic uplift forces using a factor of safety of at least 2.0.

To design the mats using the modulus of subgrade reaction method, we recommend moduli of subgrade reaction of 50 kips per cubic foot (kcf) for the Parcels 1 and 2 buildings; these values are representative of the anticipated settlement under the estimated average mat pressure previously provided.

After the mat analyses are completed, we should review the computed settlement and bearing pressure profiles to check that the moduli are appropriate.

Resistance to lateral loads can be mobilized by a combination of passive pressure acting against the vertical faces of the mat and friction along the base of the mat. We recommend passive resistance be calculated using the following uniform passive pressure distribution of 2,000 psf for the Parcels 1 and 2 buildings.

For the at-grade structures, the upper foot of soil should be ignored in calculation of the passive resistance unless it is confined by slabs or pavement. Frictional resistance should be computed using a base friction coefficient of 0.20, assuming a waterproofing membrane is placed below the mat. If the mat is not waterproofed (such as for the at-grade buildings or one-basement level building if a mat is used there), a base friction coefficient of 0.30 may be used. These values include a factor of safety of about 1.5.

If weak or non-engineered fill is encountered at the bottom of the mat excavation, it should be over-excavated and replaced with engineered fill or lean concrete. The bottom and sides of the mat excavation should be wetted following excavation and maintained in a moist condition until the working pad or waterproofing is placed. If the foundation soil dries during construction, the foundation may heave when exposed to moisture, which may result in cracking and distress. We should observe mat subgrade prior to placement of reinforcing steel. Mat excavations should be free of standing water, debris, and disturbed materials prior to placing concrete. Where the top of the mat is greater than 30 inches above the design groundwater level and moisture on the mat is undesirable, a capillary break and water vapor retarder should be provided beneath the mat as recommended in Section 7.3. Where the mat will extend below the design groundwater level, or within 30 inches of the design groundwater level, permanent waterproofing will be required beneath the mat. We recommend a waterproofing consultant be retained to determine the most appropriate system for this project and to provide input regarding waterproofing details. Installation of waterproofing should be performed in accordance with the manufacturer's requirements.

If the mat thickness and building loads are not sufficient to resist the seismic or hydrostatic uplift loads, tiedown anchors connected to the mat foundation may be needed. Tiedown anchors should be installed after placing the mud slab/waterproofing (where used). Additional waterproofing around the anchor penetration may be required to fill any voids left by the drilling operation.

7.2.2 Footings

The Parcel 5 garage structure may be supported on continuous strip footings bearing on native soil. The Parcel 4 and Parcel 6 structures may be supported on individual spread footings and/or continuous strip footings bearing on native soil. Continuous footings should be at least 18 inches wide and isolated spread footings should be at least 24 inches wide. To reduce the potential for movement of the footings due to shrink and swell of the expansive clay, we recommend that perimeter footings be bottomed at

least 30 inches below the lowest adjacent soil subgrade. Interior footings should extend at least 24 inches below the lowest adjacent soil subgrade (measured from the top of the select fill). If at least three feet of select fill is placed on a building pad, the minimum footing embedment depth may be decreased to 24 inches. The footings may be designed using an allowable bearing pressure of 3,000 psf for dead plus live loads and 4,300 psf for total design loads, which include wind or seismic forces.

Lateral loads may be resisted by a combination of passive pressure on the vertical faces of the footings and friction between the bottoms of the footings and the supporting clay. To compute lateral resistance, we recommend using an allowable uniform pressure of 2,000 psf (rectangular distribution) in the native soil and an allowable equivalent fluid weight (triangular distribution) of 300 pounds per cubic foot (pcf) in the compacted select fill. The upper foot of soil should be ignored unless confined by a slab or pavement. Frictional resistance should be computed using a base friction coefficient of 0.30. The passive pressure and frictional resistance values include a factor of safety of at least 1.5.

Footing excavations should be free of standing water, debris, and disturbed materials prior to placing concrete. The bottoms and sides of the footing excavations should be moistened following excavation and maintained in a moist condition until concrete is placed. If the foundation soil dries during construction, the footing will eventually heave, which may result in cracking and distress. We should check footing excavations prior to placement of reinforcing steel.

Positive surface drainage should be provided around the building to direct surface water away from the foundations. In addition, roof downspouts should be discharged into controlled drainage facilities to keep the water away from the foundations.

7.2.3 Soil Improvement

As previously discussed, if the estimated settlements are not acceptable, the proposed structures at Parcels 4 and 6 may be supported on mats or spread footings over improved soil. We recommend the soil improvement be achieved by installing RAPs or CLSM columns. All RAP and CLSM column systems are installed under design-build contracts by specialty contractors. Therefore, we do not provide specific design recommendations or settlement estimates for these systems. Our geotechnical report should be provided to potential RAP and CLSM column designers for preliminary design and cost estimating purposes, and we should be retained to provide technical input and review the design prior to construction. We estimate RAPs and CLSM columns for the at-grade buildings at Parcels 4 and 6 would

be on the order of 35 to 40 feet long. A mat foundation or spread footings supported on soil improved using RAP or CLSM columns generally can be designed for allowable bearing capacities of 5,000 to 6,000 psf for dead plus live loads. The design capacity of the RAPs and CLSM columns should be verified by at least one load test in compression and one test in tension, if uplift elements are used. We should provide load test parameters and confirm that an acceptable factor of safety exists for RAP or CLSM design.

To compute passive resistance along the sides of the mat we recommend using the values presented in Section 7.2.1, except that frictional resistance against the base of the mat should be calculated based on parameters provided by the RAP/CLSM design-build contractor.

7.3 Moisture Protection for Mats and Floor Slabs

For the Parcel 5 building, if the basement finished floor elevation is within 30 inches of the design groundwater level and moisture intrusion through the slab is a concern, we recommend the mat or floor slab be waterproofed to prevent moisture transmission through it. Due to the expected seasonal fluctuations in moisture content, a bentonite-based water proofing membrane (which requires constant hydration) should not be used. The basements for the Parcels 1 and 2 buildings will be below groundwater and we recommend the mats be waterproofed. We recommend a waterproofing consultant be retained to determine the most appropriate system for this project and to provide input regarding waterproofing details. Installation of waterproofing should be performed in accordance with the manufacturer's requirements.

For mat foundations with finished floor elevations greater than 30 inches above the design groundwater level (such as the at-grade buildings planned for Parcels 4 and 6 and possibly the building with one basement level planned for Parcel 5, depending on the basement finished floor elevation) and where moisture on the floor slab is undesirable, we recommend installing a capillary moisture break and water vapor retarder beneath the mat to reduce water vapor transmission through the floor slab or mat where moisture migration through the slab is a concern. A capillary moisture break and vapor retarder are generally not required below parking garage slabs/mats because there is sufficient air circulation to limit condensation of moisture on the slab surface. Therefore, the capillary moisture break/vapor retarder described below may not be needed for where parking levels are planned. Where the capillary moisture break/vapor retarder is not used, the mat or floor slab should be underlain by six inches of Caltrans

Class 2 AB. The AB should be compacted to at least 95 percent relative compaction. If a gravel working pad is used at the subgrade level, this may be used as the final subgrade condition for the slab-on-grade (i.e. AB would not be required for this condition).

A capillary moisture break consists of at least four inches of clean, free-draining gravel or crushed rock. The vapor retarder should meet the requirements for Class C vapor retarders stated in ASTM E1745-97. The vapor retarder should be placed in accordance with the requirements of ASTM E1643-98. These requirements include overlapping seams by six inches, taping seams, and sealing penetrations in the vapor retarder. The vapor retarder should be covered with two inches of sand to aid in curing the concrete and to protect the vapor retarder during slab construction. The particle size of the gravel/crushed rock and sand should meet the gradation requirements presented in Table 4.

TABLE 4
Gradation Requirements for Capillary Moisture Break

Sieve Size	Percentage Passing Sieve
<i>Gravel or Crushed Rock</i>	
1 inch	90 - 100
3/4 inch	30 - 100
1/2 inch	5 - 25
3/8 inch	0 - 6
<i>Sand</i>	
No. 4	100
No. 200	0 - 5

The sand overlying the membrane should be moist at the time concrete is placed; however, there should be no free water present in the sand. Excess water trapped in the sand could eventually be transmitted as vapor through the slab. If rain is forecast prior to pouring the slab, the sand should be covered with plastic sheeting to avoid wetting. If the sand becomes wet, concrete should not be placed until the sand has been dried or replaced.

Concrete mixes with high water/cement (w/c) ratios result in excess water in the concrete, which increases the cure time and results in excessive vapor transmission through the slab. Therefore, concrete for the floor slab should have a low w/c ratio - less than 0.50. If approved by the project

structural engineer, the sand can be eliminated and the concrete can be placed directly over the vapor retarder, provided the w/c ratio of the concrete does not exceed 0.45 and water is not added in the field. If necessary, workability should be increased by adding plasticizers. In addition, the slab should be properly cured. Before the floor covering is placed, the contractor should check that the concrete surface and the moisture emission levels (if emission testing is required) meet the manufacturer's requirements.

7.4 Permanent Below-Grade and Retaining Walls

Below-grade walls, including basement walls, utility boxes, and retaining walls, should be designed to resist both static lateral earth pressures and lateral pressures caused by earthquakes. We recommend basement and other restrained walls be designed for the more critical of the following criteria:

- at-rest equivalent fluid weight of 60 pcf for walls that are fully backdrained and 95 pcf for walls below the design groundwater level or without a backdrain, plus a traffic increment where the retaining wall is adjacent to streets. The traffic increment consists of a uniform (rectangular distribution) lateral pressure of 100 psf, applied over the entire wall height.
- active equivalent fluid weight of 40 pcf for walls that are fully backdrained and above the design groundwater level and 85 pcf for walls below the design groundwater level or without a backdrain, plus a seismic earth pressure using an equivalent fluid weight of 25 pcf (triangular distribution).

Foundations for basement and retaining walls can be designed using the recommendations presented in Section 7.2. Resistance to lateral loads on basement and retaining walls may be computed using passive resistance and base friction coefficient values provided in Section 7.2.

A backdrain should be provided behind basement and retaining walls to prevent the buildup of hydrostatic pressure. One acceptable method for backdraining basement and retaining walls is to place a prefabricated drainage panel against the backside of the newly cast wall. If temporary shoring is used, the panel may be placed directly on the shoring prior to casting the wall. The panel should extend down to a perforated PVC collector pipe or an equivalent "flat" pipe (such as AdvanEdge) at the base of the wall or shoring; where walls are above the groundwater level, the drain should extend to a pipe at the design groundwater level. The PVC pipe should be bedded on and covered by at least 4 inches of Class 2 permeable material (per Caltrans Standard Specifications) or drain rock, and the aggregate material should be surrounded by filter fabric (Mirafi 140NC or equivalent). If a flat pipe surrounded by a filter

fabric is used, it is not necessary to surround it with rock. A closed pipe should be sloped to drain to a suitable outlet. If water is collected in a sump, a pumping system may be required to carry the water to the storm drain system.

To protect against moisture migration, basement and below-grade walls should be waterproofed and water stops placed at all construction joints. The waterproofing should be placed directly against the backside of the walls, or on the backdrain panels (where temporary shoring is used).

During placement of backfill behind basement and retaining walls, the walls should be braced, or hand compaction equipment should be used, to prevent surcharges on walls or foundations (as determined by the structural engineer).

7.5 Temporary Cut Slopes and Shoring

7.5.1 Temporary Cut Slopes

We judge that temporary cuts in native soil that are less than 12 feet high and inclined no steeper than 1.5:1 (horizontal:vertical) will be stable provided that they are above the groundwater level and are not surcharged by equipment or building material. Temporary shoring will be required where temporary slopes are not possible because of space constraints.

7.5.2 Temporary Shoring

For design of a cantilevered shoring system, we recommend using an active earth pressure equivalent to a fluid weight of 40 pcf, assuming the ground behind the shoring is level. Where excavation depths exceed 12 feet, tiebacks or internal bracing will likely be required. Lateral earth pressures for the different types of recommended shoring systems are presented on Figures 5 and 6.

If traffic is within a distance equal to the shoring depth, a uniform surcharge load of 100 psf acting on the upper 10 feet should be used in the design. In addition, shoring should be designed for surcharge loads where there will be construction equipment, stockpiled soil, adjacent footings, or other surcharge loads above an imaginary 60-degree line (from the horizontal) projected from the bottom of the shoring. Construction equipment should not be allowed within five feet from the edge of the excavation unless the shoring is specifically designed for the appropriate surcharge. The increase in pressure should be computed after the surcharge loads are known.

For computing lateral resistance below the bottom of the excavation, we recommend using the passive pressures presented on Figures 5 and 6 for the appropriate excavation level.

Vertical loads on the shoring can be resisted by skin friction along the back side of the soldier piles and perimeter of soil-cement columns/wall below the bottom of the excavation. We recommend using an allowable skin friction value of 550 psf along the back side of the soldier piles above the excavation level and 750 psf along the perimeter of the soldier piles below the bottom of the excavation to compute vertical capacities for the shoring, which includes a factor of safety of 1.5. End bearing should be neglected.

The anticipated deflections of the shoring system should be estimated to check if they are acceptable. The shoring system should be sufficiently rigid to prevent detrimental movement of the temporary shoring and possible damage to existing improvements, including underground utilities and structures, adjacent to the site. In our experience, the deflection of a properly designed shoring system should generally be held to one inch or less. The shoring and tieback system should be designed so that it does not conflict with nor damage existing improvements outside the site boundaries.

The shoring system should be installed by an experienced shoring specialty contractor. The contractor should be familiar with applicable local, state, and federal regulations for temporary shoring, including the current OSHA Excavation and Trench Safety Standards. The shoring designer should be responsible for shoring design. We should review the final shoring plans to check that they are consistent with the recommendations presented in this report. In addition, we recommend a representative from our office observe the installation of the temporary shoring system.

Temporary tiebacks may be used to restrain the shoring. The vertical load from the temporary tiebacks should be accounted for in the design. Design criteria for tiebacks are also presented on Figures 5 and 6. As shown, tiebacks should derive their load-carrying capacity from the soil behind an imaginary line sloping upward from a point $H/5$ feet away from the bottom of the excavation at an angle 60 degrees from horizontal, where H is the wall height in feet. The minimum stressing and bond lengths should be 15 feet each. The shoring designer should be responsible for determining the actual length of tieback required. The determination should be based on the designer's familiarity with the installation method to be used. The computed bond length should be confirmed by a performance- and proof-testing program

under the observation of an engineer experienced in this type of work. Replacement tiebacks should be installed for tiebacks that fail the load test. The bottom of the excavation should not extend more than two feet below a row of unsecured tiebacks.

Tiebacks will generally be installed in stiff to hard clay with variable sand and gravel content and medium dense to very dense sand and gravel with variable clay content. Allowable capacities of the tiebacks will depend upon the drilling method, shaft diameter, grout pressure, and workmanship. Because of the tendency of sand and gravel layers to cave, augers should not be used in these materials. We recommend a smooth-cased method (such as a Klemm rig) be used to install tiebacks in these materials. For estimating purposes, we recommend using the skin friction values for pressure-grouted tiebacks given on Figures 5 and 6.

The first two production tiebacks and two percent of the remaining tiebacks should be performance-tested to 1.25 times the design load. The remaining tiebacks should be confirmed by a proof-test to 1.25 times the design load. The performance tests will be used to determine the load carrying capacity of the tiebacks and the residual movement. The performance-tested tiebacks should be checked 24 hours after initial lock off to confirm stress relaxation has not occurred. If any tiebacks fail to meet the proof-testing requirements, additional tiebacks should be added to compensate for the deficiency, as determined by the shoring designer.

The movement of each tieback should be monitored with a free-standing, tripod-mounted dial gauge during performance and proof testing. The performance test is used to verify the capacity and the load-deformation behavior of the tiebacks. It is also used to separate and identify the causes of tieback movement, and to check that the designed unbonded length has been established. In the performance test, the load is applied to the tieback in several cycles of incremental loading and unloading. During the test, the tieback load and movement are measured. The maximum test load should be held for a minimum of 10 minutes, with readings taken at 0, 1, 3, 6, and 10 minutes. If the difference between the 1- and 10-minute reading is less than 0.04 inch during the loading, the test is discontinued. If the difference is more than 0.04 inch, the holding period is extended by 50 minutes to 60 minutes, and the movements should be recorded at 15, 20, 25, 30, 45, and 60 minutes.

A proof test is a simple test used to measure the total movement of the tieback during one cycle of incremental loading. The maximum test load should be held for a minimum of 10 minutes, with readings taken at 0, 1, 2, 3, 6, and 10 minutes. If the difference between the 1- and 10-minute reading is less

than 0.04 inch, the test is discontinued. If the difference is more than 0.04 inch, the holding period is extended by 50 minutes to 60 minutes, and the movements should be recorded at 15, 20, 25, 30, 45, and 60 minutes.

We should evaluate the tieback test results to determine whether the tiebacks are acceptable. A performance- or proof-tested tieback with a ten-minute hold is acceptable if the tieback carries the maximum test load with less than 0.04 inch movement between one and 10 minutes, and total movement at the maximum test load exceeds 80 percent of the theoretical elastic elongation of the unbonded length.

A performance- or proof-tested tieback with a 60-minute hold is acceptable if the tieback carries the maximum test load with less than 0.08 inch movement between six and 60 minutes, and total movement at the maximum test load exceeds 80 percent of the theoretical elastic elongation of the unbonded length. Tiebacks that failed to meet the first criterion will be assigned a reduced capacity.

If the total movement of the tiebacks at the maximum test load does not exceed 80 percent of the theoretical elastic elongation of the unbonded length, the contractor should replace the tiebacks.

7.6 Pavement Design

7.6.1 Asphalt Concrete Pavement

The State of California resistance value (R-value) method for flexible pavement design was used to develop recommendations for asphalt concrete pavement sections. We anticipate the final soil subgrade in areas to receive asphalt concrete pavement will generally consist of clay. The R-value test performed on clay collected from Boring B-5 indicates the material has an R-value of 13. Previous R-value testing performed by Moore Twining Associates, Inc. indicates the soil at the site has an R-value between about 11 and 15. We used an R-value of 11 in our calculations.

For our calculations, we assumed a Traffic Index (TI) of 4.5 for automobile parking areas with occasional trucks, and 6.0 for driveways and truck-use areas; these TIs should be confirmed by the project civil engineer. Table 6 presents our preliminary recommendations for asphalt pavement sections. Recommendations for subgrade preparation beneath pavement sections are provided in Section 7.1.2. AB should be compacted to at least 95 percent relative compaction.

TABLE 6
Asphaltic Concrete Pavement Section Design
Resistance Value = 11

TI	Asphalt Concrete (inches)	Class 2 Aggregate Base R = 78 (inches)
4.5	2.5	8.5
6.0	3.5	11.5

7.6.2 Portland Cement Concrete Pavement

Concrete pavement design is based on a maximum single-axle load of 18,000 pounds and a maximum tandem axle of 32,000 pounds (corresponds to a garbage truck). The recommended rigid pavement section for these axle loads is seven inches of Portland cement concrete over six inches of Caltrans Class 2 AB. If only passenger cars or light trucks will use the pavement, the recommended minimum pavement section is five inches of Portland cement concrete over six inches of Class 2 AB. AB should conform to the current State of California Department of Transportation (Caltrans) Standard Specifications.

Because of the presence of expansive soil, the pavement section should rest on at least six inches of select fill, in addition to the Class 2 AB. Recommendations for compaction of select fill are presented in Section 7.1.3. Recommendations for subgrade preparation and AB compaction for Portland cement concrete pavement are the same as those for asphalt concrete pavement.

The modulus of rupture of the concrete should be at least 500 psi at 28 days. Contraction joints should be constructed at 15-foot spacing. Where the outer edge of a concrete pavement meets asphalt pavement, the concrete slab should be thickened by 50 percent at a taper not to exceed a slope of 1 in 10.

7.7 Concrete Flatwork

If it is desirable to reduce the potential for differential movement and cracking, exterior concrete flatwork should be underlain by at least 12 inches of select fill, lime-treated soil, or Caltrans Class 2 AB, which should extend at least two feet beyond the slab edges. Even with 12 inches of select fill, lime-treated soil, or AB, exterior slabs may experience some cracking due to shrinking and swelling of the underlying

expansive soil. Thickening the slabs and adding additional reinforcement will control this cracking to some degree. In addition, where slabs provide access to the building, it would be prudent to dowel the slab to the foundation at the entrance to permit rotation of the slab as the exterior ground shrinks and swells and to prevent a vertical offset at the entries. Recommendations for subgrade preparation beneath concrete flatwork are provided in Section 7.1.2.

7.8 Drainage

Positive surface drainage should be provided around the buildings and water tank to direct surface water away from the foundations. To reduce the potential for water ponding adjacent to the structures, we recommend the ground surface within a horizontal distance of five feet from a building slope down away from the building with a surface gradient of at least two percent in unpaved areas and one percent in paved areas. In addition, roof downspouts should be discharged into controlled drainage facilities to keep the water away from the foundations. Because the subgrade soil consists predominantly of clay, it will have a relatively low permeability and infiltration into the soil is not feasible. If infiltration basins, bioswales, or permeable pavement are planned, drains should be provided beneath them that direct the water to an appropriate outlet. Infiltration basins or bioswales should not be placed within five feet of the foundations.

7.9 Irrigation and Landscaping Limitations

The use of water-intensive landscaping around the perimeter of the buildings should be avoided to reduce the amount of water introduced to the expansive clay subgrade. In addition, irrigation of landscaping around the buildings should be limited to drip or bubbler-type systems. The purpose of these recommendations is to avoid large differential moisture changes adjacent to the foundations, which has been known to cause large differential settlement over short horizontal distances in expansive soil, resulting in cracking of slabs and architectural damage.

Moderately to highly expansive native clay is expected to be present at or near the subgrade level. For this condition, prior experience and industry literature indicate some species of high water-demand⁸ trees can induce ground surface settlement by drawing water from the expansive soil and causing it to shrink. Where these types of trees are planted adjacent to structures, the ground-surface settlement may result in damage to the structures. This problem usually occurs ten or more years after project completion as

⁸ "Water-demand" refers to the ability of the tree to withdraw large amounts of water from the soil subgrade, rather than soil suction exerted by the root system.

the trees reach mature height. To reduce the risk of tree-induced, ground-surface settlement, we recommend trees of the following genera not be planted within a horizontal distance from the buildings equal to the mature height of the tree: *Eucalyptus*, *Populus*, *Quercus*, *Crataegus*, *Salix*, *Sorbus* (*simple-leafed*), *Ulmus*, *Cupressus*, *Chamaecyparis*, and *Cupressocyparis*. Because this is a limited list and does not include all genera than may induce ground-surface settlement, the project landscape architect should use judgment in limiting other types or trees with similar properties in the vicinity of the buildings.

7.10 Seismic Design

The closest active fault to the site is the Monte Vista – Shannon Fault, a Type B fault, which is about 5.5 kilometers from the site. In addition, the San Andreas Fault, a Type A fault, is about 9.5 kilometers from the site. Although some liquefaction is expected to occur at the site during a major earthquake (as discussed in Section 6.1.2), we judge the liquefaction will occur in thin, isolated, and discontinuous layers; therefore we conclude Site Class D is appropriate for the site. For seismic design in accordance with the provisions of 2010 California Building Code (CBC) we recommend the following:

- Site Class D
- Maximum Considered Earthquake (MCE) S_s and S_1 of 1.71g and 0.72g, respectively.
- Site Coefficients F_a and F_v of 1.0 and 1.5
- Maximum Considered Earthquake (MCE) spectral response acceleration parameters at short periods, S_{MS} , and at one-second period, S_{M1} , of 1.71g and 1.08g, respectively.
- Design Earthquake (DE) spectral response acceleration parameters at short period, S_{DS} , and at one-second period, S_{D1} , of 1.14g and 0.72g, respectively.

8.0 ADDITIONAL GEOTECHNICAL SERVICES

Prior to construction, Treadwell & Rollo should review the project plans and specifications to check their conformance with the intent of our recommendations. During construction, our field engineer should provide on-site observation and testing services during subgrade preparation, excavation, shoring installation, excavation and installation of foundations, and fill placement and compaction, including utility trench backfill. These observations will allow us to compare the actual with the anticipated soil conditions and to check that the contractor's work conforms with the geotechnical aspects of the plans and specifications.

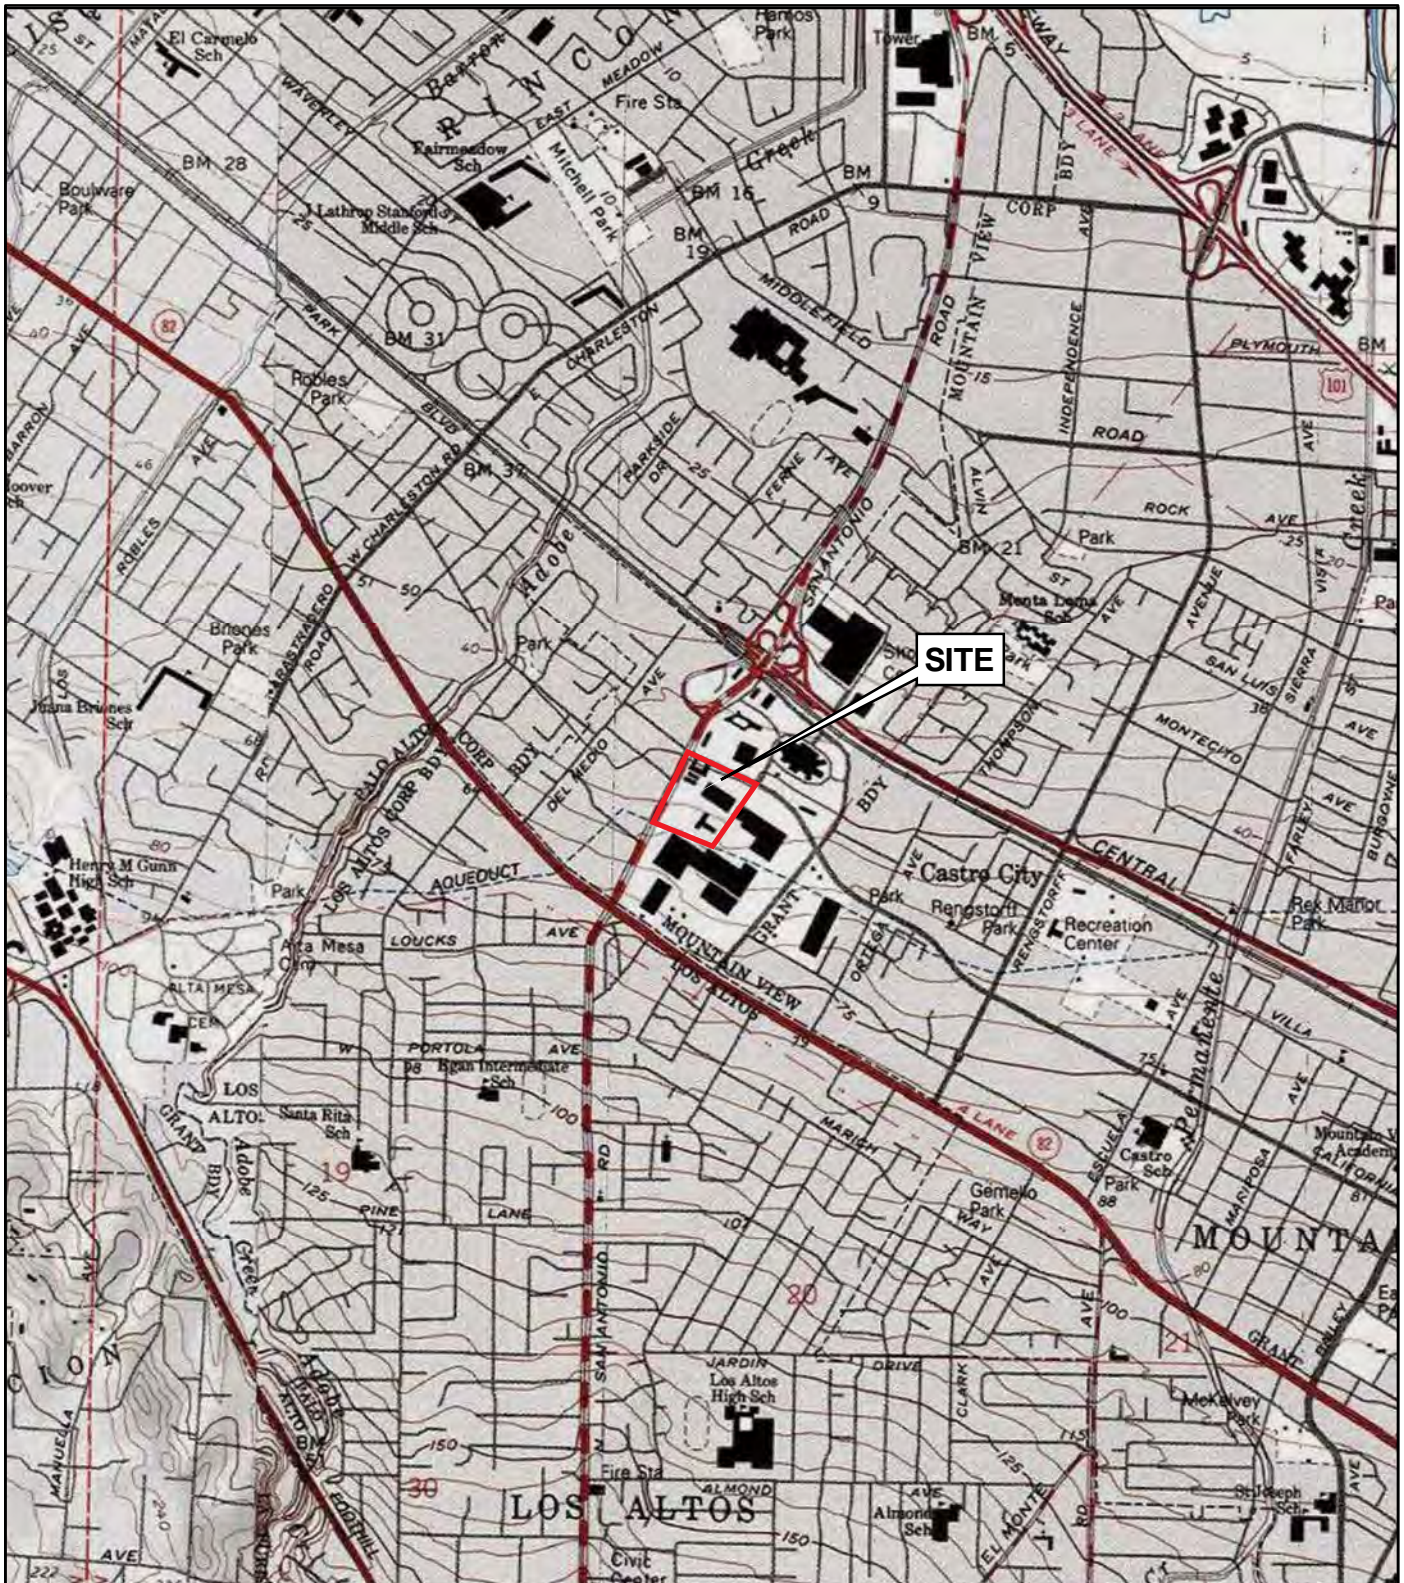

9.0 LIMITATIONS

The conclusions and recommendations presented in this report result from limited engineering studies based on our interpretation of the geotechnical conditions existing at the time of the investigation. Actual subsurface conditions may vary. If any variations or undesirable conditions are encountered during construction, or if the planned construction will differ from that described in this report, Treadwell & Rollo, A Langan Company should be notified to make supplemental recommendations, if necessary.

MAP OF MAJOR FAULTS AND EARTHQUAKE EPICENTERS IN THE SAN FRANCISCO BAY AREA

Date 02/08/13 | Project No. 731578603 | Figure 3

- I **Not felt by people, except under especially favorable circumstances. However, dizziness or nausea may be experienced.**
Sometimes birds and animals are uneasy or disturbed. Trees, structures, liquids, bodies of water may sway gently, and doors may swing very slowly.
- II **Felt indoors by a few people, especially on upper floors of multi-story buildings, and by sensitive or nervous persons.**
As in Grade I, birds and animals are disturbed, and trees, structures, liquids and bodies of water may sway. Hanging objects swing, especially if they are delicately suspended.
- III **Felt indoors by several people, usually as a rapid vibration that may not be recognized as an earthquake at first. Vibration is similar to that of a light, or lightly loaded trucks, or heavy trucks some distance away. Duration may be estimated in some cases.**
Movements may be appreciable on upper levels of tall structures. Standing motor cars may rock slightly.
- IV **Felt indoors by many, outdoors by a few. Awakens a few individuals, particularly light sleepers, but frightens no one except those apprehensive from previous experience. Vibration like that due to passing of heavy, or heavily loaded trucks. Sensation like a heavy body striking building, or the falling of heavy objects inside.**
Dishes, windows and doors rattle; glassware and crockery clink and clash. Walls and house frames creak, especially if intensity is in the upper range of this grade. Hanging objects often swing. Liquids in open vessels are disturbed slightly. Stationary automobiles rock noticeably.
- V **Felt indoors by practically everyone, outdoors by most people. Direction can often be estimated by those outdoors. Awakens many, or most sleepers. Frightens a few people, with slight excitement; some persons run outdoors.**
Buildings tremble throughout. Dishes and glassware break to some extent. Windows crack in some cases, but not generally. Vases and small or unstable objects overturn in many instances, and a few fall. Hanging objects and doors swing generally or considerably. Pictures knock against walls, or swing out of place. Doors and shutters open or close abruptly. Pendulum clocks stop, or run fast or slow. Small objects move, and furnishings may shift to a slight extent. Small amounts of liquids spill from well-filled open containers. Trees and bushes shake slightly.
- VI **Felt by everyone, indoors and outdoors. Awakens all sleepers. Frightens many people; general excitement, and some persons run outdoors.**
Persons move unsteadily. Trees and bushes shake slightly to moderately. Liquids are set in strong motion. Small bells in churches and schools ring. Poorly built buildings may be damaged. Plaster falls in small amounts. Other plaster cracks somewhat. Many dishes and glasses, and a few windows break. Knickknacks, books and pictures fall. Furniture overturns in many instances. Heavy furnishings move.
- VII **Frightens everyone. General alarm, and everyone runs outdoors.**
People find it difficult to stand. Persons driving cars notice shaking. Trees and bushes shake moderately to strongly. Waves form on ponds, lakes and streams. Water is muddied. Gravel or sand stream banks cave in. Large church bells ring. Suspended objects quiver. Damage is negligible in buildings of good design and construction; slight to moderate in well-built ordinary buildings; considerable in poorly built or badly designed buildings, adobe houses, old walls (especially where laid up without mortar), spires, etc. Plaster and some stucco fall. Many windows and some furniture break. Loosened brickwork and tiles shake down. Weak chimneys break at the roofline. Cornices fall from towers and high buildings. Bricks and stones are dislodged. Heavy furniture overturns. Concrete irrigation ditches are considerably damaged.
- VIII **General fright, and alarm approaches panic.**
Persons driving cars are disturbed. Trees shake strongly, and branches and trunks break off (especially palm trees). Sand and mud erupts in small amounts. Flow of springs and wells is temporarily and sometimes permanently changed. Dry wells renew flow. Temperatures of spring and well waters varies. Damage slight in brick structures built especially to withstand earthquakes; considerable in ordinary substantial buildings, with some partial collapse; heavy in some wooden houses, with some tumbling down. Panel walls break away in frame structures. Decayed pilings break off. Walls fall. Solid stone walls crack and break seriously. Wet grounds and steep slopes crack to some extent. Chimneys, columns, monuments and factory stacks and towers twist and fall. Very heavy furniture moves conspicuously or overturns.
- IX **Panic is general.**
Ground cracks conspicuously. Damage is considerable in masonry structures built especially to withstand earthquakes; great in other masonry buildings - some collapse in large part. Some wood frame houses built especially to withstand earthquakes are thrown out of plumb, others are shifted wholly off foundations. Reservoirs are seriously damaged and underground pipes sometimes break.
- X **Panic is general.**
Ground, especially when loose and wet, cracks up to widths of several inches; fissures up to a yard in width run parallel to canal and stream banks. Landsliding is considerable from river banks and steep coasts. Sand and mud shifts horizontally on beaches and flat land. Water level changes in wells. Water is thrown on banks of canals, lakes, rivers, etc. Dams, dikes, embankments are seriously damaged. Well-built wooden structures and bridges are severely damaged, and some collapse. Dangerous cracks develop in excellent brick walls. Most masonry and frame structures, and their foundations are destroyed. Railroad rails bend slightly. Pipe lines buried in earth tear apart or are crushed endwise. Open cracks and broad wavy folds open in cement pavements and asphalt road surfaces.
- XI **Panic is general.**
Disturbances in ground are many and widespread, varying with the ground material. Broad fissures, earth slumps, and land slips develop in soft, wet ground. Water charged with sand and mud is ejected in large amounts. Sea waves of significant magnitude may develop. Damage is severe to wood frame structures, especially near shock centers, great to dams, dikes and embankments, even at long distances. Few if any masonry structures remain standing. Supporting piers or pillars of large, well-built bridges are wrecked. Wooden bridges that "give" are less affected. Railroad rails bend greatly and some thrust endwise. Pipe lines buried in earth are put completely out of service.
- XII **Panic is general.**
Damage is total, and practically all works of construction are damaged greatly or destroyed. Disturbances in the ground are great and varied, and numerous shearing cracks develop. Landslides, rock falls, and slumps in river banks are numerous and extensive. Large rock masses are wrenched loose and torn off. Fault slips develop in firm rock, and horizontal and vertical offset displacements are notable. Water channels, both surface and underground, are disturbed and modified greatly. Lakes are dammed, new waterfalls are produced, rivers are deflected, etc. Surface waves are seen on ground surfaces. Lines of sight and level are distorted. Objects are thrown upward into the air.

TEST GEOTECH LOG 731578603.GPJ TR.GDT 10/7/13

Boring terminated at a depth of 81.5 feet below ground surface.
Boring backfilled with cement grout.
Groundwater encountered at 13 feet below ground surface during drilling.
Upper 5 feet hand augered to check for utilities.
PP = pocket penetrometer

¹ S&H and SPT blow counts for the last two increments were converted to SPT N-Values using factors of 0.7 and 1.2, respectively to account for sampler type and hammer energy.
² Elevations based on NAVD 88 datum.

Project No.:
731578603

Figure:
A-1c

Boring location: See Site Plan, Figure 2

Logged by: J. Ray

Date started: 2/19/13

Date finished: 2/19/13

Drilling method: Rotary Wash

Hammer weight/drop: 140 lbs./30 inches

Hammer type: Automatic

Sampler: Sprague & Henwood (S&H), Standard Penetration Test (SPT), Shelby Tube (ST)

TEST GEOTECH LOG 731578603.GPJ TR.GDT 10/7/13

Boring terminated at a depth of 46.5 feet below ground surface.
Boring backfilled with cement grout.
Groundwater encountered at 14.5 feet below ground surface one day after drilling.
Upper 5 feet hand augered to check for utilities.
PP = pocket penetrometer

¹ S&H and SPT blow counts for the last two increments were converted to SPT N-Values using factors of 0.7 and 1.2, respectively to account for sampler type and hammer energy.
² Elevations based on NAVD 88 datum.

TEST GEOTECH LOG 731578603.GPJ TR.GDT 10/7/13

Boring terminated at a depth of 48 feet below ground surface.
Boring backfilled with cement grout.
Groundwater encountered at 15.5 feet below ground surface during drilling.
Upper 5 feet hand augered to check for utilities.
PP = pocket penetrometer

¹ S&H and SPT blow counts for the last two increments were converted to SPT N-Values using factors of 0.7 and 1.2, respectively to account for sampler type and hammer energy.
² Elevations based on NAVD 88 datum.

Project No.:
731578603

Figure:
A-12b

UNIFIED SOIL CLASSIFICATION SYSTEM

	Major Divisions	Symbols	Typical Names
Coarse-Grained Soils (more than half of soil > no. 200 sieve size)	Gravels (More than half of coarse fraction > no. 4 sieve size)	GW	Well-graded gravels or gravel-sand mixtures, little or no fines
		GP	Poorly-graded gravels or gravel-sand mixtures, little or no fines
		GM	Silty gravels, gravel-sand-silt mixtures
		GC	Clayey gravels, gravel-sand-clay mixtures
	Sands (More than half of coarse fraction < no. 4 sieve size)	SW	Well-graded sands or gravelly sands, little or no fines
		SP	Poorly-graded sands or gravelly sands, little or no fines
		SM	Silty sands, sand-silt mixtures
Fine-Grained Soils (more than half of soil < no. 200 sieve size)	Silts and Clays LL = < 50	ML	Inorganic silts and clayey silts of low plasticity, sandy silts, gravelly silts
		CL	Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, lean clays
		OL	Organic silts and organic silt-clays of low plasticity
	Silts and Clays LL = > 50	MH	Inorganic silts of high plasticity
		CH	Inorganic clays of high plasticity, fat clays
		OH	Organic silts and clays of high plasticity
Highly Organic Soils		PT	Peat and other highly organic soils

SAMPLE DESIGNATIONS/SYMBOLS

GRAIN SIZE CHART		
Classification	Range of Grain Sizes	
	U.S. Standard Sieve Size	Grain Size in Millimeters
Boulders	Above 12"	Above 305
Cobbles	12" to 3"	305 to 76.2
Gravel coarse fine	3" to No. 4	76.2 to 4.76
	3" to 3/4" 3/4" to No. 4	76.2 to 19.1 19.1 to 4.76
Sand coarse medium fine	No. 4 to No. 200	4.76 to 0.075
	No. 4 to No. 10	4.76 to 2.00
	No. 10 to No. 40 No. 40 to No. 200	2.00 to 0.420 0.420 to 0.075
Silt and Clay	Below No. 200	Below 0.075

- Sample taken with Sprague & Henwood split-barrel sampler with a 3.0-inch outside diameter and a 2.43-inch inside diameter. Darkened area indicates soil recovered

***** COMMENTS *****							
<p>Resistivities are in the 1,000-1,500+ ohm-cm range, i.e., very low to low (assign Ø-10 pts & Ø-8 pts, depending on exact specifications); soil reactions (i.e., pHs) are mildly to very mildly acidic range (assign Ø pts for ea); both chloride and sulfate levels are low to very low (Cl @ <100 ppm & SO₄ @ <200 ppm, assign Ø pts); soils are mildly reduced (assign Ø-3.5 pts, depending on specs). Standard CalTrans times to perforation for these soils are as follows: for VSA1 and 18 ga steel the time is ≈11 yrs, and for 12 ga it goes up to ≈24.5 yrs; for VSA2 the respective times are >12 yrs, and ≈28 yrs. For gray/ductile/mild steels and cast iron the calculated average pitting rates for these soils are 0.28 mm/yr for VSA1 and 0.18 mm/yr for VSA2 putting the 2 mm depth times at ≈7.1 yrs, and ≈11.1 yrs, respectively, and the 4 mm depth times would be at ≈14 yrs, and at ≈22 yrs. Chloride levels are not high enough to adversely impact on steel reinforcement (in std concrete mixes); similarly, sulfates are low enough that there should be no adverse impact on concrete, cement, mortar & grout. Soil redoxes are such that there could be some mild adverse impact on construction materials (i.e., concrete or steel). In principle, the soils could benefit from alkaline treatment in that raising their pHs to the 7.5-8.5 range would improve (CalTrans) perf times for 18 ga to <30 yrs, and <27 yrs, respectively; pitting rates change to ≈0.092 mm/yr for VSA1 and to ≈0.1 mm/yr for VSA2 putting 2 mm depth times at <22 yrs, and ≈20 yrs, respectively. But such treatment only has longevity in protected locations (e.g. underneath slabs, buildings, etc.), and does not persist long in open environment settings. Otherwise, metals longevities can be improved by upgrading (e.g. increased gauge or more resistant steels, etc.). In fact, structural strength considerations often will require heavier steel than used in the present examples such that perf & pitting times can be well beyond specified life span. Where this is not the case, cathodic protection of coated steel pipe or boxes could be done as a potential solution for these assets. And other alternatives include increased or specialized engineering fill, and/or use of plastic, fiberglass or concrete pipe, etc. As a rule, standard concrete mixes should be fine in these soils based on these results. Last, total points for buried steels would be in the Ø-13.5 pts range for VSA1 and at Ø-11.5 pts for VSA2, depending on the precise requirements for this particular project. Thus, while these soils should pass most specifications, the most stringent specifications would require remedial action for buried steels; or rejection of the soils.</p>							
<p>\\NOTES: Methods are from following sources: extractions by Cal Trans protocols as per Cal Test 417 (SO₄), 422 (Cl), and 532/643 (pH & resistivity); &/or by ASTM Vol. 4.08 & ASTM Vol. 11.01 (=EPA Methods of Chemical Analysis, or Standard Methods); pH - ASTM G 51; Spec. Cond. - ASTM D 1125; resistivity - ASTM G 57; redox - Pt probe/ISE; sulfate - extraction Title 22, detection ASTM D 516 (=EPA 375.4); chloride - extraction Title 22, detection ASTM D 512 (=EPA 325.3); sulfides - extraction by Title 22, and detection EPA 376.2 (=SMEWW 4500-S D); cyanides - extraction by Title 22, and detection by ASTM D 4374 (=EPA 335.2).</p>

	High plasticity clay
	Poorly graded gravel

Misc. Symbols

	Boring continues
	Water table during drilling

Notes:

1. Test borings were drilled between 7-20-09 through 7-24-09 and on 7-31-09 using a CME 75 drill rig equipped with 6-5/8" O.D. Hollow Stem Augers and 5" O.D. Solid Flight Augers.
2. Groundwater was encountered at approximately 18 to about 35 feet BSG in the majority of the boring(s) drilled between 7-20-09 through 7-24-09 and on 7-31-09.
3. Test boring locations were located by measuring wheel or measuring tape with reference to the existing features.
4. These logs are subject to the limitations, conclusions, and recommendations in this report.
5. Results of tests conducted on samples recovered are reported on the logs. Abbreviations used are:

DD = Natural dry density (pcf)	LL = Liquid Limit (%)
UC = Unconfined compression (psf)	PI = Plasticity Index (%)
-4 = Percent passing #4 sieve (%)	pH = Soil pH
-200 = Percent passing #200 sieve (%)	SS = Soluble sulfates (%)
SR = Soil resistivity (ohm-cm)	Cl = Soluble chlorides (%)
c = Cohesion (psf)	ø = Angle of internal friction (degrees)
TS = Field Torvane Shear Strength test (tons per square foot)	N/A = Not applicable
pcf = pounds per cubic foot	N/E = Not encountered
psf = pounds per square foot	AMSL = Above Mean Sea Level
O.D. = Outside Diameter	HSA = Hollow Stem Augers
SFA = Solid Flight Augers

Executive Summary

TOR Environmental, Inc. (TOR) was retained by Glaser Weil Fink Jacobs Howard Avchen & Shapiro LLP (Glaser Weil) on behalf of MGP IX REIT LLC (MGP) to prepare a Phase I Environmental Site Assessment (Phase I ESA) for San Antonio Center located at 405, 417, 419 and 423 South San Antonio Road, Mountain View, California 94040 (Figure 1). For the purpose of this report the Machado property will be referred to as the "Subject Property". The Machado property is also identified by Santa Clara County Assessor Parcel Number 148-22-008 and consists of approximately 3.591 acres of improved land.

The Phase I ESA was conducted on behalf of Glaser Weil and MGP as part of a financial transaction with Wells Fargo and all will be referred to as the User throughout this report. This Phase I ESA will provide the User with a baseline understanding of environmental conditions present at the Subject Property using the guidelines set forth in the American Society of Testing and Materials (ASTM) E1527-05 standard practice.

The purpose of this Phase I ESA is to identify *recognized environmental conditions* ("RECs"), as defined by ASTM E1527-05 that may have affected the Subject Property. Findings that are not RECs, but do have some potential to have affected the Subject Property are identified as *Notable Findings* for the purpose of this report.

As defined by ASTM, a REC is "the presence or likely presence of any hazardous substance or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substance or petroleum products into the structure, on the property, or into the ground, groundwater, or surface water of the property." The term *historical recognized environmental condition* means an environmental condition which in the past would have been considered a *recognized environmental condition*, but which may or may not be considered as a *recognized environmental condition* currently.

Conclusions

The Machado Property was constructed in approximately 1960 on agricultural property approximately 3.59 acres in size. The Subject Property includes one (1) commercial retail structure totaling approximately 45,873 square feet of floor space. This Phase I Environmental Site Assessment completed in accordance with ASTM E1527-05 revealed the following:

- Soil or groundwater impacts resulting from historic or current land uses of the Site at concentrations that would be classified as a *REC* under ASTM E1527-05 were not revealed as a result of this review.
- Listings for a dry cleaner business on the Subject Property in historic city directories between 1962 and 1986 are a *Notable Finding* for this Phase I ESA. Information pertaining to the dry cleaning business from federal, state, and local regulatory agencies were not available for this business. Review of groundwater analytical testing results from

the sites crossgradient and downgradient of the Subject Property did not reveal dry cleaner chemical impacts.

- Soil or groundwater impacts originating from off-site sources that would be classified as a REC for the Subject Property under ASTM E1527-05 were not revealed as a result of this Phase I ESA.
- Sears is currently in the process of assessing the extent of impacts associated with a recently identified and reported release from their former service elevator at 455 San Antonio Road. Although the potential for such a release to extend onto the Subject Property is low, the former source is upgradient of the Subject property and constitutes a *Notable Finding* for this Phase I ESA.

Recommendations

Based on the conclusions provided above, TOR does not recommend further environmental evaluation for the Subject Property at this time. TOR recommends the property owner continue to monitor Sears' activities upgradient until the company receives regulatory site closure.

Section 1: Introduction

TOR Environmental, Inc. (TOR) was retained by Glaser Weil Fink Jacobs Howard Avchen & Shapiro LLP (Glaser Weil) on behalf of MGP IX REIT LLC (MGP) to prepare a Phase I Environmental Site Assessment (Phase I ESA) for the Machado property located at 405, 417, 419 and 423 South San Antonio Road, Mountain View, California (Figure 1). For the purpose of this report, the Machado property will be referred to as the “Subject Property”. The Machado property is also identified by Santa Clara County Assessor Parcel Number 148-22-008 and consists of approximately 3.591 acres of improved land.

This Phase I ESA was conducted on behalf of Glaser Weil and MGP as part of a financial transaction with Wells Fargo and all will be referred to as the User throughout this report. This Phase I ESA will provide the User with a baseline understanding of environmental conditions present at the Subject Property using the guidelines set forth in the American Society of Testing and Materials (ASTM) E1527-05 standard practice.

1.1 Purpose

The purpose of this Phase I ESA is to identify *recognized environmental conditions* (“RECs”), as defined by ASTM E1527-05 that may have affected the Subject Property. Findings that are not RECs, but do have some potential to have affected the Subject Property are identified as *Notable Findings* for the purpose of this report.

As defined by the ASTM, a REC is “the presence or likely presence of any hazardous substance or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substance or petroleum products into the structure, on the property, or into the ground, groundwater, or surface water of the property.” The term *historical recognized environmental condition* means an environmental condition which in the past would have been considered a *recognized environmental condition*, but which may or may not be considered as a *recognized environmental condition* currently.

The work was conducted pursuant to authorization to proceed with the project dated 15 August 2011 from Mr. Daniel G. Jordan, Esq. of Glaser Weil.

1.2 Detailed Scope of Services

1.2.1 Phase I ESA

The Phase I ESA was conducted in general accordance with the United States Environmental Protection Agency (USEPA) All-Appropriate Inquiry (AAI) rule (40 CFR, Part 312) as described in the ASTM E1527-05 for the performance of a Phase I ESA. At a minimum, the following activities were performed to accomplish the Phase I ESA objectives:

Subject Property Reconnaissance – A visual and physical observation of the Subject Property was conducted in readily accessible areas to identify RECs or Notable Findings associated with environmental conditions. Additionally, visual observations of adjoining properties were made from the vantage point of the Subject Property as well as from public right-of-ways to assess the potential impact of these properties on the Subject Property.

Subject Property Representative Interview – An interview was conducted with individuals knowledgeable and familiar with the Subject Property.

Environmental Lien Search – An environmental lien is a charge, security, or encumbrance on a property's title to secure payment of cost or debt arising from response actions, cleanup, or other remediation of hazardous substances or petroleum products. An environmental lien search was conducted and no environmental liens or Activity and Usage Limitations (AULs) were reported by the User.

Online Agency Records Review – Available environmental reports, agency records (state and local agencies), and appropriate permits were reviewed to identify any reported environmental concern or incident associated with the Subject Property.

Historical Research – At a minimum, readily available sources of historical information related to the Subject Property and adjoining properties were researched to identify historical land use practices that have the potential to adversely impact environmental conditions at the Subject Property. Sources of historical information to help identify RECs or Notable Findings in connection with the Subject Property include historical aerial photographs, historical topographic maps, Sanborn Fire Insurance Maps, and City Directories.

Government Database Review – Published governmental federal and state databases were reviewed to identify properties within ASTM-specified radii of the Subject Property with a reported environmental concern or incident. TOR subcontracted the compilation of government database search to Environmental Data Resources, Inc. (EDR).

Report Preparation – This written summary of the findings and recommendations of the Phase I ESA was prepared.

1.3 Environmental Professional Qualifications

This Phase I ESA was prepared under the supervision of Jeffrey D. Borum (PG 4149, EG 1330) of TOR. Mr. Borum has a Bachelor of Science degree in Earth Science, a Master of Science degree in Geology, and is a California Professional Geologist with 30 years of professional experience. Mr. Borum meets the qualifications for an environmental professional as stated in the ASTM E1527-05 standard.

1.4 Limitations and Exceptions

This Phase I ESA is based on review of readily available environmental records, results of limited interviews, and visual observations of recent Subject Property conditions. The collection or analysis of environmental samples; surveys regarding the presence of asbestos, radon, heavy metal-based paints; or compliance of individual property operations with environmental regulations were not executed during this Phase I ESA. This assessment was not intended to be a comprehensive inspection or assessment of all conditions that might exist at the Subject Property. Findings were developed based on our professional opinion and do not represent a

warranty, guarantee, certification, or positive assertion as to the presence, absence, or extent of potential contamination. TOR's activities were conducted in accordance with practices and procedures generally accepted in the consulting field. TOR's services were limited to those specified in our proposal, which was accepted and authorized by Glaser Weil and MGP.

1.5 Special Terms and Conditions

This report represents TOR's professional opinion and judgment, which are dependent upon information obtained during performance of consulting services. Environmental conditions may exist at the Subject Property that cannot be identified by visual observations or were obscured from view by vegetation, poor lighting, or other materials during TOR's visit to the Subject Property. TOR's conclusions were based in part on information supplied by others, the accuracy or sufficiency of which has not been independently reviewed by TOR. No investigation can be thorough enough to exclude the presence of hazardous materials at a given Subject Property; therefore, if no hazardous materials are identified during an assessment, such a finding should not be construed as a guarantee of the absence of such materials on the Subject Property, but rather the results of services performed within project scope, cost, schedule, and other limitations.

Any opinions presented apply to the Subject Property conditions at the time of performance of services and do not address the potential for future releases. Changes in applicable environmental standards, practices, or regulations may occur following performance of services, which could impact the opinions presented.

1.6 Reliance

This report is intended for the sole use of Glaser Weil, MGP, affiliates of MGP and Wells Fargo. If other parties wish to rely on this report, please have them contact TOR so that a mutual understanding and agreement of the terms and conditions for our services can be established prior to their use of this information

Section 2: Subject Property Description

The following section provides information about the Subject Property, such as its ownership, general description, environmental setting, current property usage, and also describes the general uses of the adjoining properties and surrounding area.

2.1 Property Owner Information

Machado-San Antonio Partners L.L.C. is the current owner of the Subject Property. The Subject Property includes Assessor Parcel Number 148-022-008.

2.2 Subject Property Description

The Subject Property is adjacent north of the San Antonio Center and is situated in a primarily commercial area of Mountain View, California. The property has been improved with 22 foot-tall, one-story, retail commercial building totaling approximately 45,873 square feet (SF) and constructed in 1960. Based on review of the Santa Clara County Assessor's office parcel information, the property historically has been associated with addresses 405, 409, 413, 415, 417, 423, and 425 S. San Antonio Road. The building currently houses four (4) tenants with addresses as shown in the table below.

BUSINESS NAME	ADDRESS
Ross for Less	405 San Antonio Road
Kumon	419 San Antonio Road
Fantastic Nails	417 San Antonio Road
BevMo!	423 San Antonio Road

Subject Property is situated approximately between 49-53 feet above mean sea level (amsl) sloping gently toward California Street bounding the northern property line. Storm water runoff drains towards the north into the municipal storm water drainage system which flows into the San Francisco Bay, approximately 3 miles to the north northeast of the Subject Property.

Current tenants of the Subject Property are retail clothing, retail beverages, personal groomer, and educational development. These businesses are not registered or listed as involved in using, storing, treating, or transporting hazardous materials and exhibit a low potential to cause soil or groundwater contamination.

2.3 Adjoining Properties and Surrounding Vicinity

A generalized description of the surrounding area is as follows:

North: California Street bounds the Subject Property to the north where various retail stores front the street. San Antonio Cleaners is a property of environmental interest. The names and addresses of businesses along California Street (some have San Antonio Rd. addresses) adjacent north of the Subject Property include:

BUSINESS NAME	ADDRESS
Planned Parenthood	225 San Antonio Road
Vacant	225 San Antonio Road
San Antonio Cleaner	225 California Street
Beauty Nails	225 San Antonio Road
Hair 7	225 San Antonio Road
City Financial	225 San Antonio Road
Vacant	225 San Antonio Road
Dentist	225 San Antonio Road
Safeway	2580 California Street

East: Various retail shops within the San Antonio Center are located east of the Subject Property and are accessed both from California Street and Showers Drive. None of these businesses are registered generators of hazardous waste and all exhibit a low potential to impact soil/groundwater beneath the Subject Property. Names and addresses of adjacent businesses to the east of the Subject Property include:

BUSINESS NAME	ADDRESS
Jo Ann's	350 S San Antonio Road
24 Hour Fitness	2535 California Street
Carter's	550 Showers Drive
Nails 4 U	550 Showers Drive

Sketchers	560 Showers Drive
Vacant	560 Showers Drive
Vacant	570 Showers Drive
Trader Joe's	590 Showers Drive
Krungthai Restaurant	590b Showers Drive
Gamestop	510 Showers Drive
Kohl's	350 Showers Drive

West: Retail shops and restaurants border the Subject Property to the west. Valero Gas Station on the corner of San Antonio Road and California Street is a fuel storage and distribution facility and has underground storage tanks on site. These improvements are regulated and tracked by regulatory agencies as a preventive step towards reducing the chance of a release. None of the other businesses are registered as a generator of hazardous waste and as such exhibit a low potential to impact the Subject Property. The names and addresses of adjacent businesses west to the Subject Property include:

BUSINESS NAME	ADDRESS
Valero Gas Station	334 San Antonio Road
Vacant	365 San Antonio Road
Barron Park Plumbing	377 San Antonio Road
La Fiesta Super Mrkt.	391 San Antonio Road
Oh My Sushi	2595 California Street
Savor Mexico	2585 California Street
Milk Pail Market	2575 California Street

The Valero Gas Station is situated at the former location of Texaco.

South: Retail shopping areas of the San Antonio Center adjacent south of the Subject Property include the former Sears Auto Center and Sears retail store with address 455 San Antonio Road. The Sears retail store was the anchor tenant for the San Antonio Center since the late 1950's. South of Sears was a coop building with several retail businesses and the former Quality Tune Up was just south of the coop building. All these businesses vacated the

premises in early and mid-2011. The property is currently being redeveloped and will include the construction of a new mixed-use commercial/residential complex with underground parking in the area formerly occupied by the Sears retail building. The names and addresses of the hydraulically upgradient businesses to the south of the Subject Property included:

BUSINESS NAME	ADDRESS
Sears Auto Center	455 San Antonio Road
Sears	455 San Antonio Road
Sports Authority	635 San Antonio Road
Party City	645 San Antonio Road
Burger King	665 San Antonio Road
Rite Aid	685 San Antonio Road
Quality Tune Up	2580 El Camino Real

The Sears Auto Center was housed in a one-story building with a footprint of approximately 15,140 SF located approximately 150 feet south of the Subject Property. The Sears Auto Center building also included a partial basement of about 7,200 SF. This full service automotive facility included a customer lobby, office and storage spaces, and a service garage located on the ground level. Sumps and drains were reportedly sealed in the late 1980s to prevent discharge of potentially hazardous substances to the storm water or sewer system. Five (5) underground storage tanks were removed and closed by the regulatory agencies in 1987. No documented releases were reported. Eleven hydraulic lifts and one electric lift were housed in the service bay of the garage until the beginning of 2011 when they were excavated and disposed by Sears. The Mountain View Fire Department oversaw the process and no release of hazardous substances to soil or groundwater was discovered. The Fire Department provided regulatory closure for the decommissioning work (Appendix G).

During the decommissioning of the Sears retail store, a hydraulic leak from the service elevator was discovered (April 2011). Sears signed a Voluntary Cleanup Agreement with the County of Santa Clara and is assessing the nature and extent of the impact in soil and groundwater. The release report from Sears is included in Appendix J. The potential for the release from the hydraulic lift associated with the service elevator in the Sears retail store hydraulically upgradient from the Subject Property to impact the Subject Property appears low based on the chemicals involved, geologic materials associated with the leak and distance from the Subject Property. Nevertheless, this is a *Notable Finding* and the owner of the Subject Property should monitor Sears' assessment activities through the County of Santa Clara until the site is closed.

Businesses in the coop building (635-685 San Antonio Road) were not known to store, use, treat or transport hazardous materials and exhibit a low potential to impact soil and groundwater. The Quality Tune Up site at 2580 El Camino Real had a release of gasoline to soil and groundwater reported in May of 1986. The site was remediated and the case was closed in September of 1996. The facility was demolished in the summer of 2010 and six (6) hydraulic lifts were removed as a part of the decommissioning process. The Mountain View Fire Department oversaw the activities and the County of Santa Clara reviewed the data and closed the site in December of 2010 (Appendix A).

2.4 Environmental Setting

This section describes the geologic and hydrogeologic features in the region surrounding and beneath the Subject Property.

2.4.1 Regional Geology

The Santa Clara Valley is a geologic structural trough formed within the confines of the San Andreas Fault system in the San Francisco Bay area. The valley is bounded on the southwest by the Santa Cruz Mountains and the San Andreas Fault, and on the northeast by the Diablo Range and the Hayward Fault. The Subject Property is underlain by Holocene continental alluvial and bay deposits. Plio-Pleistocene poorly sorted and stratified alluvial gravels, sands, silts and clays of the Santa Clara Formation underlie the Holocene deposits. These geologic formations evolved as a result of the uplift and erosion of the bordering Coast Range. Lithologic similarities make distinction of these two units difficult (DWR 1975). The two geologic formations unconformably overlie non-water bearing folded Tertiary rocks (CDMG, 1966).

Land uplift and subsidence in Santa Clara Valley due to the recharge and withdrawal of groundwater is well documented by several public agencies such as the Santa Clara Valley Water District (SCVWD) and the USGS (Poland and Ireland, 1988). An increase in the withdrawal of water from the Santa Clara Formation aquifer and a decrease in rainfall for the first half of the twentieth century resulted in a substantial drop in well levels and corresponding land subsidence of approximately 13 feet. Subsidence in the Mountain View area between 1934 and 1967 is shown between 4 and 6 feet. Recovery efforts over the past quarter century, such as the import of water from outside sources and the construction of percolation ponds, have allowed water levels to partially recover in more permeable areas of the aquifer system. Recovery has not occurred where silt and clay soil structures have collapsed. The Subject Property is situated greater than 100-150 feet above the northern extent of the confined aquifer system.

Groundwater on the adjacent Sears property was encountered at approximately 20 feet below the ground surface or approximately 43 feet AMSL (Appendix G).

2.4.2 Hydrogeologic Information

Groundwater information for the Subject Property and surrounding area was not provided in EDR GeoCheck – “Hydrogeologic Information” summary. The “Aquiflow Information System” (Aquiflow®) indicates groundwater flows generally to the northeast based on information from ½-1 mile east southeast of the Subject Property. Review of soil and groundwater characterization information included in reports provided by the owner (Appendix G) and posted

on the GeoTracker website for the adjacent property indicates groundwater flows predominantly in a northerly direction (Appendix J).

The unconsolidated Holocene clays silts and sands that underlie the Subject Property are the upper confining layer for the groundwater aquifer estimated to be at approximately 100-150 feet bgs. Artesian springs and flowing wells were common in the area prior to development and extraction as a water supply. Groundwater is unconfined around the valley margins and recharge of the confined aquifer is dependent on infiltration in these areas.

Groundwater information for the Subject Property and surrounding area was provided in an assessment of groundwater relating to a former underground storage tank release at 2585 El Camino Real on the south side of San Antonio Center (adjacent property). Seven groundwater monitoring wells installed in this area recorded groundwater elevations between approximately 44.47 feet above mean sea level (amsl) and 43.98 feet amsl. Groundwater flowed towards the north (Ground Zero Analysis, 1996). The topography at the Subject Property slopes gently to the north and east and groundwater flow direction appears to mimic surface topography.

Groundwater was encountered in all four subsurface penetrations installed as a part of the assessment of soil and groundwater completed by KEH & Associates around the adjacent Sears Building at 455 San Antonio Road (Appendix G). The depth at which groundwater was encountered varied around approximately 20 feet bgs (42.20 amsl) at this location. Careful observation of soil cores extracted through the water bearing zone suggest more permeable sands occur as discontinuous layers within the gravelly silty clay dominate the upper 25 feet (Appendix A). The elevation of groundwater in this area of the Subject Property is very close to the elevation of groundwater observed at the Quality Tune Up site at 2580 El Camino Real.

2.5 Public Water Wells

According to the "EDR Geocheck" (Appendix A), Federal United States Geological Survey (USGS) well information lists two (2) groundwater wells between $\frac{1}{2}$ and 1 mile of the Subject Property. The Federal FRDS Public Water Supply System Information does not list any public water supply wells within a mile of the Subject Property.

Nineteen (19) State of California wells are included on the database listing. Thirteen (13) of these wells are located between $\frac{1}{2}$ -1 mile southwest and three (3) between $\frac{1}{2}$ and 1 mile southeast of the Subject Property. One (1) well is located between $\frac{1}{2}$ -1 mile east southeast. One (1) well is located $\frac{1}{2}$ -1 mile north northwest and one (1) well is located $\frac{1}{2}$ -1 mile north northeast of the Subject Property. "EDR Geocheck" figure showing water wells in the area is included in Appendix A. These wells appear to be or to have been monitoring wells for groundwater quality. Several of the wells are listed as having been destroyed as is common, when assessment and remediation sites are closed by the regulatory agencies. Other wells could be used for industrial purposes and may influence hydraulic gradient at the Subject Property.

The status of each well and other relevant data are also provided in Appendix A.

2.6 Oil and Gas Wells

Based on TOR's review of maps provided by the State of California Department of Conservation Division of Oil, Gas, & Geothermal Resources (DOGGR) and the EDR Geospatial Data (Appendix A), no active or plugged oil and gas or geothermal wells are located within a one-mile radius of the Subject Property.

Section 3: Government Database Review

A review of federal, state, and tribal environmental databases related to the Subject Property and surrounding area in accordance with the ASTM E 1527-05 search radius was conducted to identify potential RECs. Properties listed have, or might have, the potential for existing or future site contamination, environmental liabilities, or the potential for contamination migration to surrounding areas. Information from these various databases was compiled by EDR and presented in the Radius Map Report (Appendix A).

Government database listings reviewed during this Phase I ESA included, but were not limited to:

- USEPA National Priorities List (NPL) within a 1-mile radius;
- USEPA Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS) sites within a ½-mile radius;
- USEPA Comprehensive Environmental Response-No Further Remedial Action Planned (CERC-NFRAP) sites within a ¼-mile radius;
- USEPA Corrective Action Report (CORRACTS) sites within a 1-mile radius;
- USEPA Resource Conservation and Recovery Information System-Treatment, Storage, and Disposal (RCRIS-TSD) sites within a ½-mile radius;
- USEPA “RCRIS-Large Quantity Generator” (RCRIS-LQG) within a ¼-mile radius;
- USEPA “RCRIS-Small Quantity Generator” (RCRIS-SQG) within a ¼ mile radius;
- USEPA Facility Index System/Facility Registry System (FINDS) for the Subject Property only;
- USEPA Emergency Response Notification System (ERNS) sites within the target property;
- California EnviroStor Database – ENVIROSTOR within a 1-mile radius;
- California Calsites Database – HIST CAL-SITES within a 1-mile radius;
- California Bond Expenditure Plan (BEP) within a 1-mile radius;
- California Waste Management Unit Database System (WMUDS/SWAT) within a ½-mile radius;
- California Cortese within a ½-mile radius;
- California Leaking Underground Storage Tank (LUST) within a ½-mile radius;

- California Facility Inventory Database (CA FID) within a ¼-mile radius;
- California Spills, Leaks, Investigation and Cleanups (SLIC) sites within a ½-mile radius;
- California Underground Storage Tanks (UST) within a ¼-mile radius;
- California Hazardous Substance Storage Container (HIST UST) within a ¼-mile radius;
- California Statewide Environmental Evaluation and Planning System (SWEEPS UST) within a ¼-mile radius;
- California Hazardous Material Incident Report System (CHMIRS) for the Subject Property only;
- California 65 Notification Records within a 1-mile radius;
- California Voluntary Cleanup Program Properties (VCP) within a ½-mile radius;
- California Cleaners within a ¼-mile radius; and
- California Facility and Manifest Data (HAZNET) for the Subject Property only.

The full list of databases compiled, along with definitions for each, is included in Appendix A. The lists record activities associated with hazardous substances, but are not of themselves indicative of contamination or the threat of contamination. Monitoring wells formerly located on the adjacent property at 2580 El Camino Real as well as the property located at 2595 California Street indicates groundwater flows to the north northeast. Sites located hydraulically cross- or downgradient or in areas separated from the Subject Property by a topographic ridge or river channel (drainage divide) or located downgradient in relation to the Subject Property, are evaluated but not necessarily discussed in the report but are included in Appendix A.

3.1 Subject Property Summary

None of the addresses associated with the Subject Property were listed on any of the government environmental databases searched by EDR. There were no records noting violations or releases of hazardous wastes to the environment. The potential for hazardous wastes to have caused more than *de minimus* soil or groundwater contamination on the Subject Property is low, based on the government's environmental database for the businesses currently operating.

This assessment included the review of historic city directories that list businesses that may have operated at the Subject Property in the past. Depending on the years of operation, these businesses may have been present prior to the government regulation. The findings associated with the review of city directories are presented in Section 4.3 of this report.

3.2 Surrounding Property Summary

Several sites located within a one-mile radius of the Subject Property are listed in the EDR "Radius Map Report" under one or more of the following databases:

- Local Lists of Registered Storage Tanks
- State and Tribal Equivalent NPL
- State and Tribal Lists of Registered Storage Tanks
- State and Tribal Leaking Storage Tanks
- Local Lists of Hazardous Waste/Contaminated Sites
- Local Lists of Landfill/Solid Waste Disposal Sites
- State and Tribal Equivalent CERLIS
- Federal CERCLIS
- Federal RCRA Generators List, and
- Other Ascertainable Records

A Summary Table displaying the results of the list review for businesses in the vicinity of the Subject Property is shown below and details are included in Appendix A. The summary table lists database name, number of sites on that database, their distance from the Subject Property, their location in relation to topographic elevation measured on the Subject Property and the businesses' current regulatory status.

Summary Table: Environmental Regulatory Database Review

Environmental Database	Number Listed Sites	Distance from Subject Property	Elevation Relative to Subject Property	Regulatory Status <i>(topographically higher sites which potentially pose the greatest REC risks are shown in red)</i>
CERC-NFRAP	1	1- sites ¼-½ mile	1-higher	1-NO NPL, Cert O&M

Cortese	1	1-site ¼-½ mile	1-higher	1-Certified O&M
HIST CORTESE	17	8-sites 0- ⅛ mile 2-sites ⅛-¼ mile 7-sites ¼-½ mile	3-higher 5-lower 1-higher 1-lower 7-higher	2-Case Closed 1-Listed Only 5-Case Closed 1-Case Closed 1-Case Closed 4-Case Closed 1-Registration 1-No further Action 1-Verification Monitoring
Notify 65	1	1-site ½-1 mile	1-higher	1-Open Site Assessment*
DRYCLEANERS	3	3-sites ⅛-¼ mile	3-higher	2-Inactive 6/30/06-both same location 1-no longer at this address*

*Discussed in more detail below

The Shell Service Station at 110 N Rengstorff in Mountain View is listed on the Notify 65 list at a distance of approximately 0.630 (3,326 feet) east of the Subject Property. The regulatory status is shown as “Open-Site Assessment”. The property is approximately 3 feet higher in elevation than the Subject Property and groundwater flow direction is towards the north northeast. These conditions suggest there is a low potential for the released contaminants from this Shell Service Station to flow under the Subject Property.

Camaro Cleaners and Holiday Cleaners listed on the DryCleaners database were both located at 660 San Antonio Road. Although both businesses are currently inactive, neither had regulatory violations or reported a release to soil or groundwater. Subsurface investigation and groundwater sampling and analytical testing on the Sears property in March of 2011 did not reveal dry cleaning chemical impacts between the Subject Property and the dry cleaning businesses. The potential for the historic dry cleaning businesses located at 660 San Antonio Road to impact soil or groundwater on the Subject Property is low based on these groundwater analytical testing data.

California Cleaners is located at 2425 California Street, approximately 1,309 feet east of the Subject Property at approximately 62 feet AMSL. Because of its distance cross gradient it demonstrates a low potential to cause soil and groundwater contamination at the Subject Property.

California Cleaners was formerly located at 2520 California Street and is currently listed on the SLIC database for a release of cleaning solvents to soil and groundwater reported in 1987. Currently this site is in post remediation verification monitoring. California Cleaners has since moved to a new location further to the east at 2542 California Street. The potential for California Cleaners 2520 SLIC site to impact soil or groundwater at the Subject Property is low based on its cross-hydraulic gradient location and its distance from the Subject Property.

3.2.1 Orphan Site List

Due to incomplete address information, 20 orphan sites in the vicinity were not detailed in the EDR Radius Map Report. The lists reported suggested general site locations and normally associated reasons behind these sites becoming listed. Review of the site specific supplemental data available associated with each of the orphan sites did not reveal information indicating the potential impairment of the Subject Property (Appendix A).

Limited information concerning regulatory status, location and distance from the Subject Property, geologic conditions, groundwater hydraulic gradient, contaminants of concern, vicinity supply wells, and interviews with knowledgeable parties were considered for each business listed on the regulatory databases provided by EDR. No RECS for the Subject Property were identified in TOR's review of the EDR Radius Map Report for the surrounding area.

Section 4: Historical Use

4.1 Historical Aerial Photographic Review

Historical aerial photographs of the Subject Property and surrounding area were obtained from EDR. Photographs from 1939, 1948, 1956, 1965, 1974, 1982, 1991, 1998, 2005 and 2006 were provided to and reviewed by TOR (Appendix B). A narrative description of historical aerial photography is provided below:

- In 1939, the surrounding properties to the north, northwest, and east are mostly agricultural land. Properties to the southwest and south along El Camino Real show the beginning signs of development. The Subject Property is agricultural land. There appear to be no structures on the property. El Camino Real, San Antonio Road, and Showers Drive are present.
- The 1948 photograph appears similar to the 1939 photograph. Properties to the west and south show an increase in development. The Subject Property does not appear to have changed from the 1939 photograph.
- Development has progressed to the west and south of the Subject Property by 1956. Four commercial buildings immediately adjacent and west of the Subject Property, fronting San Antonio Road, have been constructed. There is also a new building adjacent north across California Street. Adjacent property to the east and southeast is agricultural. The property to the south is being actively graded and the coop building on the south end of San Antonio Center property has been constructed and there are cars in the parking lot. The gas station referred to in this report as Quality Tune Up is also visible.
- In 1965, surrounding properties to the north, west, south and southeast have been improved with new buildings and paved parking lots. A new building has been constructed on the Subject Property that appears to have a similar footprint as the present day building. Property to the northeast is mostly vacant land with the exception of the commercial buildings on the corner of San Antonio Road and California Street. The Sears retail building and part of the Sears Auto Center are present. California Street, San Antonio Road and Showers Drive have all been widened. Gas Stations (fuel storage and distribution facilities) are visible on the northeast, southeast, and southwest corners of the intersection between San Antonio Road and California Street. A building materials aggregates plant has been developed next to the rail line that parallels Central Expressway to the north.
- The Subject Property and surrounding area appear fully developed by 1974. The aggregate plant seen in the 1965 photograph appears to have been dismantled and moved.
- Development of the properties to the north northeast has continued and more buildings are visible to the east and southeast in the 1982 photograph. The Sears Auto Center building is complete. No significant changes are apparent to the Subject Property. The property between Central Expressway and California Street immediately north of the

Subject Property that was the former location of the aggregate plant has been redeveloped with an oval “campus” arrangement of office buildings. An approximately square commercial building has been constructed immediately across California Street from the Subject Property.

- The 1991 photograph shows no significant changes to the surrounding properties and Subject Property are apparent since the 1982 photograph. The lot on the northwest corner of Showers and California Street to the east of the Subject Property is being graded for new development.
- The buildings adjacent to the Subject Property as well as the properties east of the Sears buildings have undergone major renovation in the 1998 photograph. Previously seen buildings have been replaced by new buildings. The Subject Property does not appear to have changed since the 1991 photograph except for the landscaping on the property has matured. The campus site office development north northeast across California Street from the Subject Property has been removed and replaced with a residential development.
- The 2005 photograph shows that surrounding properties as well as the Subject Property do not appear to have altered since the 1998 photograph although the trees and landscaping has further matured.
- The 2006 photograph appears very similar to the 2005 aerial photograph.

4.2 Sanborn Fire Insurance Maps

The Sanborn Fire Insurance Maps consist of a uniform series of large-scale detailed maps, dating from 1867 through 1969 depicting the commercial, industrial, and residential sections of cities. A search of the Sanborn Fire Insurance Maps was conducted for the Subject Property and they were not available. Verification of this is included in Appendix C.

4.3 City Directories

City directories have been published for many cities and towns across the United States since the 18th century. For each address within an area, city directories list the name of each resident or, if a business operates from that address, the name and the type of business. While the geographic coverage of city directories is comprehensive for most major cities, many rural areas and small towns may not be included. In addition, many towns and cities have discontinued the practice of issuing city directories. Limited city directory coverage was available from EDR for the Subject Property and surrounding area.

City directory coverage spanned from 1922 to 2006 at approximately five year intervals. For the search, the Subject Property is identified as 405 San Antonio Road and TOR specifically requested information for the addresses listed on the Assessor Parcel Map including 405, 409, 413, 415, 417, 423, 425 San Antonio Road (Appendix F). Listings of addresses for adjoining properties were also provided for the years: 1955, 1957, 1960, 1962, 1965, 1968, 1975, 1980, 1982, 1986, 1991, and 2001. The geo-reference point for which the City directory coverage was located was placed at the approximate center of the Subject Property parcel map. Information

for this report was compiled with information gathered by geocoding the latitude and longitude of properties identified and by gathering information about properties within 660 feet of target property.

A summary of the information provided in the city directory report for properties of interest is presented below and a copy of the full report is included in Appendix D.

4.3.1 Subject Property, Historical City Directories

The following city directory listings were for historic businesses that reportedly resided on the Subject Property for the years stated:

- 405 San Antonio Road-“Thrifty Cut Rate Drug Store”, 1968.
- 409 San Antonio Road-Woolworth Department Store, 1968
- 413 San Antonio Road-Gallen Kamp Shoes, 1968
- 415 San Antonio Road, Permans Fashions Womens Clothing, 1968
- 417 San Antonio Road, San Antonio Hobby and Crafts, 1968
- 419 One Hour Martinizing Cleaners, 1968 and Porfido Dry Cleaning, 1986
- 423 Crocker Citizens National Bank, 1968

A listing for “One Hour Cleaners” in a 1968 city directory and again for Portofido Dry Cleaners in 1986 suggests a dry cleaning business operated at 419 San Antonio Road, the current address of “Kumon” math and reading center. The Phase I Environmental Site Assessment prepared by LandAmerica Commercial Services (LAC) in 2005 (Appendix G) reported listings for dry cleaners on the Subject Property in city directories published 1962, 1968, 1979, and 1984. There was no other information available to TOR during the course of this assessment period pertaining to this business. No regulatory environmental data base listings for either of the former city directory listed businesses or associated address was found during the assessment period. Interviews with knowledgeable parties did not reveal additional information. Review of building permits and Fire Department records by LAC did not yield additional information that is often times available to corroborate the listing in the city directories. Based on this information, LAC did not see the city directory listings as definitive and recommended no further investigation.

TOR reviewed analytical testing of groundwater associated with the characterization of the extent of contamination at 2591 and/or 2595 San Antonio Road. Groundwater monitoring wells positioned adjacent west of the Subject Property and adjacent northeast across California Street did not indicate impacts from chlorinated solvents typically used at dry cleaning establishments of this era. Further, the regulatory agency normally reviews analytical laboratory reports in detail and made no reference to chlorinated solvents in their correspondence and closure of the LUST site. Based on the lack of additional information concerning the existence of the dry cleaners coupled with the absence of dry cleaning solvents in groundwater downgradient of the suspected location of these directory-listed businesses, TOR does not recommend additional investigative at this time.

4.3.2 Surrounding Properties, Historical City Directories

Line S California Shell Service Station and Mikes Shell Service are listed at 2591 California Street in the 1962 and 1968 directories and the facility is listed again at 2595 California Street as Mikes Shell Service in 1986. Based on the configuration of properties at this location and historical aerial photographs, it is believed that 2591 and 2595 refer to the same physical location. The leaking underground storage tank site is reported on the Water Resources Control Board's *Geotracker* database for 2595 California Street at the intersection with San Antonio Road. The station was demolished and removed from the site in 1988. Remedial activities included over excavation, soil vapor extraction, groundwater pump and treat as well as Oxygen Releasing Compound was placed in six (6) monitoring wells to enhance bioremediation. The regulatory agency "closed" the site in 2002 stating it was no longer a threat to human health. Residual contamination was left in place at this property and the agency directs that plans for redevelopment should include a review and mitigation for the protection of human health and the environment. The address is situated on the west adjacent property at the southeast corner of the intersection between San Antonio Road and California Street (Appendix A).

Goodyear Service Store Tires 298 San Antonio Road was listed in the 1968 and 1975 directories and Victor Tire Inc. was listed at the same address in 1982 and 1986. This site had leaking waste oil tank but it is located hydraulically cross and downgradient from the Subject Property.

334 San Antonio Road, Mountain View Texaco (1986), Malones Texaco (1975), Pauls Texaco (1968). This fuel storage and distribution facility was also listed on EDR's *Radius Map Report with Geocheck* as well as the *Geotracker* database under San Antonio Valero as a "Case Closed" site (Appendix A). The Valero site, based on the direction of groundwater flow, has a low potential to have impacted the Subject Property.

Firestone Stores, Tires was listed on the city directories at 462 San Antonio Road in 1968. This site is listed in EDR's *Radius Map Report with GeoCheck* (Appendix A) as well as on the *Geotracker* database maintained by the Water Resources Control Board. The leaking underground storage tank site case closed in 1999, was located west and upgradient of the Subject Property and the nature and extent of the impacts did not include groundwater.

Kurt's Chevron Service Station is listed on the 1968 city directory as located at 2590 California Street. This business was on the northeast corner of the intersection between San Antonio Road and California Street and is downgradient of the Subject Property.

Other properties of environmental interest are included in the city directory abstract; however, they were cross or downgradient from the Subject Property and were not considered further for this Phase I ESA (Appendix D).

4.4 Topographic Maps

Historic topographic maps of the Subject Property and surrounding area were obtained from EDR. Maps from 1899, 1902, 1943, 1947, 1948, 1953, 1961, 1968, 1973, 1981, 1991, and

1997 were evaluated by TOR. A review of the topographic maps is provided below. The topographic maps are included in Appendix C.

- The Subject Property is vacant land in 1899 and 1902. Adobe Creek is also called San Antonio Creek. San Antonio Road and El Camino Real are present. The surrounding properties are undeveloped.
- In 1943, the San Antonio Creek is now called Adobe Creek. A number of smaller (possibly residential) structures are located adjacent to the Subject Property and the number of nearby streets has increased. Buildings are present on the surrounding properties, and Showers Drive is in place. The Southern Pacific Rail Road aligned to the northwest-southeast is present to the north of the Subject Property.
- No significant changes from the 1943 topographic map to the Subject Property are visible on the 1947 and 1948 topographic maps.
- The Subject Property is still vacant in 1953; however, four (4) new commercial buildings on the property that is adjacent west to the Subject Property are shown. Several of the smaller structures along this stretch of San Antonio Road are no longer present in 1953. A "pipeline" (Hetch Hetchy pipeline) traverses to the south of the Subject Property in an east-west direction. Showers Drive has been disconnected from Ortega Avenue to the east. Agricultural land is indicated to the southeast of the Subject Property.
- The commercial building on the Subject Property as well as the Sears retail store, part of the Sears Auto Center and the Co-op building are visible in 1961. The Quality Tune Up building is not shown. The pipeline noted in the 1953 topographic map is now called an aqueduct and it traverses the Subject Property on the northern side of the Sears retail store. California Street is now shown as well as the commercial building to the east of the Subject Property. Showers Drive connects El Camino Real to California Street. The amount of agricultural land to the east has decreased. Two buildings that were seen southeast of the Subject Property in the 1953 topographic map no longer exist. Several buildings visible in previous topographic maps along streets to the west and south of the Subject Property are not shown on the 1961 topographic map.
- The Quality Tune Up building and a smaller structure north of the Sears Auto Center building are present on the 1968 topographic map. Changes to buildings on the same block as the Subject Property are apparent to the north, northeast, east, and southeast. No apparent changes to the properties to the west and south are noted.
- The 1973 topographic map appears very similar to the 1968 topographic map. The Subject Property appears the same as it did in 1968 as do the surrounding properties with the exception of a new set of buildings adjacent west of the Subject Property on California Street at San Antonio Road.
- The Subject Property appears on the 1981 topographic map as it did in 1973. Properties to the north of California Street have been redeveloped. Two new buildings are shown to the east and the Sears rail building has been connected to the buildings to the east of it. Modifications to buildings in the same block as the Subject Property are apparent to

the north, northeast, east, and southeast. No significant changes to the surrounding properties to the west and south are noted.

- The 1991 topographic map depicts no significant and notable changes to the Subject Property from the 1981 topographic map. No major alterations were evident to the surrounding properties as well.
- The 1997 topographic map appears very similar to the 1991 topographic map. No changes to the Subject Property are visible.

4.5 Environmental Liens or Activity and Use Limitations

An environmental lien search was conducted for 405 San Antonio Road and no environmental liens or Activity and Usage Limitations (AULs) were reported by EDR (Appendix F). In addition, no environmental liens on the APN associated with the Subject Property were reported by the Users or the current owner of the property.

Section 5: User Provided Information

5.1 Proposed Use

This Phase I ESA was requested as part of a financial transaction between MGP and Machado-San Antonio Partners L.L.C.

5.2 User-Provided Documents

As part of the Phase I ESA, TOR reviews relevant documentation, specialized knowledge, and/or commonly known information available from Glaser Weil and MGP pertaining to the Subject Property. User provided information can be found in Appendix G.

Glaser Weil provided the following documents to TOR for review:

- 5 July, 2011, TOR Environmental, Inc. *Phase I Environmental Site Assessment, San Antonio Center, 455 San Antonio Road, Mountain View California 94040.*
- 17 March 2011, KEH & Associates, Inc., *Soil and Groundwater Assessment, San Antonio Center, 455 San Antonio Road.*
- 20 December 2011, County of Santa Clara, Voluntary Cleanup Program, *Quality Tune Up #1, 2580 W. El Camino Real, Mountain View, CA.*
- 5 December 2005, LandAmerica Assessment Corporation, *Phase I Environmental Site Assessment Report, San Antonio Center, 405-423 San Antonio Road, Mountain View, California 94041*
- 21 January 2005, PIERS Environmental Services, Inc., *Limited Phase II Site Investigation of Sears Auto Center of Sears Auto Center, 455 San Antonio Road, Mountain View, California, 21 January 2005.*
- 30 September 1996, Santa Clara Valley Water District, *Leaking Underground Storage Tank Program, Underground Storage Tank Case Closure, Quality Tune Up No. 1, 2580 El Camino Real, Mountain View, CA, Case No. 04-029, Underground Storage Tank Cleanup Fund No. 3345.*
- 21 December 2005, Giuliani & Kull, Inc., *ALTA/ACSM LAND TITLE SURVEY.*
- 2 September 2011, BKF Engineers *ALTA/ACSM LAND TITLE SURVEY, Machado-San Antonio Partners, LLC, 405 San Antonio Road, Mountain View, CA 94040.*

The previous Phase I ESA for the Subject Property prepared by LandAmerica Corporation, found no *recognized environmental conditions* and recommended that no further investigation of the Subject Property.

Several of the user-provided documents contain background information pertaining to the history of the adjacent upgradient property (Sears), regulatory agency involvement and

closure activities, current conditions, and improvements that have the potential to cause soil and groundwater impacts. We understand the engineers, construction managers and contractors involved with the redevelopment project have considered this information and permitted their activities through the appropriate regulatory agencies.

Section 6: Agency Records Review

TOR used the following agency sources to obtain information on the Subject Property and surrounding area:

- **Department of Oil, Gas & Geothermal Resources (DOGGR):** According to Version 2.0 of the Online Mapping System (DOMS), no oil and gas wells are located within a one-mile radius of the Subject Property.
- **California Department of Water Resources:** geologic information.
- **State Water Resource Control Board (SWRCB):** hydrogeologic information.
- **State Water Resources Control Board (SWRCB) Geotracker Database:** The Subject Property was not listed on the database; however, several surrounding properties including the adjacent hydraulically upgradient properties at 455 San Antonio Road and 2580 El Camino Real were listed on this database.

Sears is currently in the process of assessing the extent of contamination associated with a release of hydraulic oil from its service elevator. The former service station at 2580 El Camino Real is listed as “Case Closed” and was demolished and removed in 2010 (Appendix G).

Additional details surrounding these issues are provided in Sections 2.3, 3.2 and in the Appendices of this report.

- **Department of Toxic Substance Control (DTSC) ENVIROSTOR Database:** The Subject Property and surrounding area were not shown on this website; however, five (5) sites with a “State Response” designation are present to the east northeast of the Subject Property. These cases also appeared on the environmental database lists and are considered in Section 3.1 of this report. Those listings and their relationship to the Subject Property are shown on the Summary Table in Section 2.3 of this report. The potential for these sites to have caused groundwater contamination at the Subject Property is low.

Section 7: Interviews and Subject Property Reconnaissance

7.1 Interview

Ms. Kay Harbal, Property Supervisor, Portfolio Realty Management, Inc., completed the Interview Form on 6 September 2011 regarding her knowledge of the history and operations performed at the Subject Property. The Interview Form is appended to this report as Appendix H. According to Ms. Harbal, no hazardous substances are currently stored, used, and/or generated at the Subject Property. Ms. Harbal is unaware of any past operations at the Subject Property or immediate surrounding area that could impact soil or groundwater media beneath the Subject Property.

7.2 Subject Property Reconnaissance-Visual and Physical Observations

Edwin Schramm of TOR performed the Subject Property reconnaissance on 1 September 2011. Visual observations noted during the ground reconnaissance are included in the table below. Photographs of the Subject Property are included in Appendix I.

Subject Property Reconnaissance Summary Table

Feature / Characteristic	Y/N	Comments
Current Use of Subject Property	NA	Commercial Retail Shopping Center
Vacant Spaces / Undeveloped Areas / Wetlands	N	
Landscaping (<i>potential pesticide use</i>)	N	Asphalt paved-
Parking Lots / Structures (<i>potential for vapor intrusion or chem. Spills</i>)	Y	Historic dry cleaner directory listing (Section 4.3)
Previous Uses or Investigations		
Concrete pads (<i>associated with electrical systems or large machinery</i>)	Y	Transformers, natural gas engine, electrical installations (Appendix I)
Former Pump Islands	N	
Fill Ports (<i>small manholes associated with USTs</i>)	N	
Vent Pipes (<i>associated with USTs</i>)	N	
Former Building Foundations	N	
Drums and Containers	N	None observed
Sumps	N	
Clarifiers	N	
Hoists or Lifts (<i>often associated with hydraulic fluids & auto repair</i>)	N	
Concrete / Asphalt patches	N	
Monitor/Supply/Disposal Wells	N	None observed

Subject Property Reconnaissance Summary Table

Feature / Characteristic	Y/N	Comments
Containers / Containment		
Aboveground Storage Tanks (ASTs)	N	
Underground Storage Tanks (USTs)	N	
Hazardous Chemicals (<i>Storage, Use, Disposal</i>)	N	
Petroleum Hydrocarbons	N	
Pesticide Usage or Storage	N	None observed
Unlabeled Containers/Substances	N	None observed
Solid Waste Storage (<i>i.e. bins</i>)	Y	Waste Management
Septic Tanks	N	
Berms (<i>potential secondary containment</i>)	N	
Potential Waste Disposal Systems / Containment		
Waste Water Generation	N	
Pits, Ponds, Lagoons	N	
Pools Of Liquid	N	
Floor Drains	Y	Connected to sewer
Drainage Systems (<i>i.e. ditches</i>)	N	
Dumping or Filling Activities (<i>i.e. soil or debris piles</i>)	N	None observed
Roads And Trails With No Apparent Purpose (<i>potential for illicit dumping</i>)	N	
Potential Evidence for Chemical Impacts		
Materials Spills	N	
Unusually Stained or Corroded Pavement or Flooring	N	
Odors	N	
Air Emissions	N	
Interior water damage / mold (<i>potential pathway for impacts</i>)	N	Not observed
Stained Or Disturbed Soil	N	
Stressed Vegetation	N	
Non ASTM items & Miscellaneous		
Electrical Transformers (PCBs)	Y	PG&E owned and operated
Florescent Lighting (PCBs)	Y	PCB content unknown
Suspect Asbestos-Building Materials	Y	Based on 1960 original construction date
Water damage / Mold	N	Not observed
Suspect Lead-Based Paint	Y	Not tested
Fiber Optics Lines	N	Not observed

Subject Property Reconnaissance Summary Table

Feature / Characteristic	Y/N	Comments
Heating Systems (associated with heating oil, gas, electric or steam radiators)	N	Main Sears Retail Building
High Voltage Power Lines/ Magnetic Fields	N	Not conducted/Not observed
Cellular Phone Tower	N	Not conducted/Not observed
Neighboring Dry Cleaners	Y	No active Assessment or Remediation on-going, No violations reported-cleaners on west, east, and south perimeters
Neighboring Property USTs	Y	Valero Gas Station NW corner of San Antonio Road
Any sites NOT listed in EDR? Incorrect addresses?	N	

Section 8: Historical Materials of Concern

8.1 Suspect Asbestos-Containing Materials

While the use of asbestos in the manufacture of most building materials has not been fully prohibited by law, the use of asbestos, for the most part, has voluntarily been discontinued since the late 1970s. Some non-friable materials, such as roofing material and floor coverings (floor tile and mastic) may have been manufactured with asbestos materials and may have been used into the early 1980s. Given the Subject Property was initially developed in approximately 1960, asbestos materials should be anticipated. We understand the building was “extensively remodeled” in the 1970s and in 1997 (Appendix G).

8.2 Lead-based Paint

In 1978, the Consumer Products Safety Commission banned paint and other surface coating materials containing lead. Because the property was first developed in 1958, these materials may be present and we understand will be properly handled and removed as a part of the demolition of the current structures on the Subject Property.

8.3 PCB Equipment

Polychlorinated biphenyls (PCBs) were historically used as coolants and lubricants in transformers, capacitors, and other electrical equipment beginning in 1929 because they do not burn easily and serve as a good insulating material. Several transformers were observed on the Subject Property during the Subject Property site visit. This transformer owned by PG& E appeared in good repair and no perimeter oil staining was noted at the time of the site visit.

Fluorescent light fixtures were observed in the ceilings of most of the buildings as well as around the lighted parking lot areas. PCBs are known to be present in fluorescent light ballasts and electric transformers; although, there were no documented or observed releases of PCBs on the Subject Property at the time of the site visit. Proper handling and disposal procedures are required when handling these materials.

8.4 Radon

The Federal Environmental Protection Agency put Santa Clara County in Radon Zone 2 (indoor air average level of < 2 pCi/L). Three federal tests of radon in 1st floor living areas revealed an average concentration of 0.600 pCi/L. This information is not specific to the Subject Property and site specific testing would be required to evaluate any risk from radon.

8.5 Mold

TOR did not (i) perform a mold/fungi inspection, (ii) perform any building material surface mold sampling, or (iii) perform air sampling for mold spores at the Subject Property as part of this Phase I ESA. The property is developed and includes air conditioner and refrigeration facilities that are sometime responsible for mold development. Any demolition activities involving the structures should include inspections for mold development prior to initiation. Employee complaints or observations in this regard should also be investigated and appropriately mitigated for the protection of human health.

Section 9: Conclusions and Recommendations

TOR conducted the Phase I ESA in conformance with the scope and limitations of ASTM 1527-05 for the San Antonio Center property located at 455, 635-685 San Antonio Road in Mountain View, California. Any exceptions or deletions from this practice are detailed in Section 10 of this report.

9.1 Conclusions

The Machado Property was constructed in approximately 1960 on agricultural property approximately 3.59 acres in size. The Subject Property includes one (1) commercial retail structure totaling approximately 45,873 square feet of floor space. This Phase I Environmental Site Assessment completed in accordance with ASTM E1527-05 revealed the following:

- Soil or groundwater impacts resulting from historic or current land uses of the Site at concentrations that would be classified as a *REC* under ASTM E1527-05 were not revealed as a result of this review.
- Listings for a dry cleaner business on the Subject Property in historic city directories between 1962 and 1986 are a *Notable Finding* for this Phase I ESA. Information pertaining to the dry cleaning business from federal, state, and local regulatory agencies were not available for this business. Review of groundwater analytical testing results from the sites crossgradient and downgradient of the Subject Property did not reveal dry cleaner chemical impacts.
- Soil or groundwater impacts originating from off-site sources that would be classified as a *REC* for the Subject Property under ASTM E1527-05 were not revealed as a result of this Phase I ESA.
 - Sears is currently in the process of assessing the extent of impacts associated with a recently identified and reported release from their former service elevator at 455 San Antonio Road. Although the potential for such a release to extend onto the Subject Property is low, the former source is upgradient of the Subject property and constitutes a *Notable Finding* for this Phase I ESA.

9.2 Recommendations

Based on the conclusions provided above, TOR does not recommend further environmental evaluation for the Subject Property at this time. TOR recommends the property owner continue to monitor Sears' activities upgradient until the company receives regulatory sites.

Section 10: Deviations

No deviations from the ASTM 1527-05 standard were made during the preparation of the Phase I ESA portion of this report. Additional information pertaining to the potential existence of a dry cleaning business resident on the Subject Property was not found during the course of this Phase I ESA. The absence of such information constitutes a gap in the data for this element of the project.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-05) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.

Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal CERCLIS NFRAP site List

CERC-NFRAP: Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

A review of the CERC-NFRAP list, as provided by EDR, and dated 02/25/2011 has revealed that there is 1 CERC-NFRAP site within approximately 0.5 miles of the target property.

EXECUTIVE SUMMARY

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 06/15/2011 has revealed that there is 1 RCRA-LQG site within approximately 0.25 miles of the target property.

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 06/15/2011 has revealed that there are 9 RCRA-SQG sites within approximately 0.25 miles of the target property.

RESPONSE: Identifies confirmed release sites where DTSC is involved in remediation, either in a lead or oversight capacity. These confirmed release sites are generally high-priority and high potential risk.

A review of the RESPONSE list, as provided by EDR, and dated 06/15/2011 has revealed that there are 6 RESPONSE sites within approximately 1 mile of the target property.

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifies sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 06/15/2011 has revealed that there are 6 ENVIROSTOR sites within approximately 1 mile of the target property.

State and tribal leaking storage tank lists

LUST: The Leaking Underground Storage Tank Incident Reports contain an inventory of reported leaking underground storage tank incidents. The data come from the State Water Resources Control Board Leaking Underground Storage Tank Information System.

A review of the LUST list, as provided by EDR, and dated 06/20/2011 has revealed that there are 14 LUST sites within approximately 0.5 miles of the target property.

EXECUTIVE SUMMARY

HIST LUST: A listing of open and closed leaking underground storage tanks. This listing is no longer updated by the county. Leaking underground storage tanks are now handled by the Department of Environmental Health.

A review of the HIST LUST list, as provided by EDR, and dated 03/29/2005 has revealed that there are 12 HIST LUST sites within approximately 0.5 miles of the target property.

State and tribal registered storage tank lists

UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the State Water Resources Control Board's Hazardous Substance Storage Container Database.

A review of the UST list, as provided by EDR, and dated 06/20/2011 has revealed that there is 1 UST site within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

SWEEPS UST: Statewide Environmental Evaluation and Planning System. This underground storage tank listing was updated and maintained by a company contacted by the SWRCB in the early 1990's. The listing is no longer updated or maintained. The local agency is the contact for more information on a site on the SWEEPS list.

A review of the SWEEPS UST list, as provided by EDR, and dated 06/01/1994 has revealed that there are 7 SWEEPS UST sites within approximately 0.25 miles of the target property.

Other Ascertainable Records

RCRA-NonGen: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA-NonGen list, as provided by EDR, and dated 06/15/2011 has revealed that there is 1 RCRA-NonGen site within approximately 0.25 miles of the target property.

Hazardous Waste Summary:

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKEY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D018
Waste name: BENZENE

Violation Status: No violations found

SAN ANTONIO CLEANERS (Continued)

1000595148

Historical Generators:

Date form received by agency: 10/26/1991
Facility name: SAN ANTONIO CLEANERS
Classification: Small Quantity Generator

Hazardous Waste Summary:

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKEY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: F002
Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS: TETRACHLOROETHYLENE, METHYLENE CHLORIDE, TRICHLOROETHYLENE, 1,1,1-TRICHLOROETHANE, CHLOROBENZENE, 1,1,2-TRICHLORO-1,2,2-TRIFLUOROETHANE, ORTHO-DICHLOROBENZENE, TRICHLOROFLUOROMETHANE, AND 1,1,2-TRICHLOROETHANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE LISTED IN F001, F004, OR F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Violation Status: No violations found

Registry ID: 110001152626

Environmental Interest/Information System

The NEI (National Emissions Inventory) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

The NEI (National Emissions Inventory) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Hazardous Waste Summary:

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKEY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Waste code: D003
Waste name: A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.

Environmental Interest/Information System

The NEI (National Emissions Inventory) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

 Case Worker: LG
 Local Agency: Not reported
 RB Case Number: 43s1033
 File Location: Not reported
 Potential Media Affected: Other Groundwater (uses other than drinking water)
 Potential Contaminants of Concern: * Solvents
 Site History:

No Water Board oversight of cleanup at this site. This case is included in Geotracker because the site is covered by the Water Board's NPDES general permits for discharges from opump and treato systems to surface waters (one each for fuels- and VOC-impacted sites). This can happen for two reasons: (i) the site is overseen by another agency (e.g., USEPA or DTSC) and needs coverage under one of the NPDES general permits or (ii) construction dewatering in an area of groundwater contamination necessitates NPDES general permit coverage. Including this case in Geotracker helps staff to receive and review required NPDES reports.

Responsible Party: RESPONSIBLE PARTY-LEAD SITE CLEANUP WORKPLAN
 Project Revenue Source Company: Plessey, Inc.
 Project Revenue Source Addr: 325 Westchester Avenue
 Project Revenue Source City,St,Zip: White Plains, NY 10604
 Project Revenue Source Desc: DHS has issued a remedial action order and Plessey has stipulated to comply with this order. DHS has budgeted \$50,000 for oversight and monitoring of cleanup efforts. DHS will recover 100 percent of direct costs plus staff costs and overhead relatedto the project. The responsible parties will pay all costs associated with remedial investigations and cleanup activities.

Site Description: From about the mid-1960s to 1981, Plessey manufactured electronic components. Chemical processes used included plating and etching. Wastewater was drained to underground storage tanks where material or waste was neutralized and stored prior to disposal.

Hazardous Waste Desc: Wastes include perchloroethylene (PCE), trichloroethylene (TCE), chromic acid and xylene.

Threat To Public Health & Env: Depth of the shallowest aquifer is about 32 feet. Ground water contamination and its potential impact on drinking water supplies is the primary concern.

Site Activity Status: Plessey Micro Sciences, Inc., retained a contractor and completed a preliminary

Environmental Interest/Information System

California Department of Toxic Substances Control EnviroStor System (DTSC-EnviroStor) is an online search and Geographic Information System (GIS) tool for identifying sites that have known contamination or sites for which there may be reasons to investigate further. The EnviroStor database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Alternate Address: 2274 MORA DRIVE
Alternate City,St,Zip: MOUNTAIN VIEW, CA 94040
Background Info: Plessey Micro Sciences began electronic component manufacturing operations at the site in the mid-1960s. Four underground storage tanks were initially installed to collect contaminated rinse water. The collection system was used for xylene reclamation and acid neutralization. In January 1981, Plessey ceased operations and vacated the Site.

semisolid wastes from any servicing, producing, manufacturing or processing operation of whatever nature, including mining, gravel washing, geothermal operations, air conditioning, ship building and repairing, oil production, storage and disposal operations, water pumping.

Facility Status: Active - Any facility with a continuous or seasonal discharge that is under Waste Discharge Requirements.

NPDES Number: CAG912003 The 1st 2 characters designate the state. The remaining 7 are assigned by the Regional Board

Subregion: 2

Facility Telephone: 4158991600

Facility Contact: Susan Gahry (PES)

Agency Name: MARCONI PLC

Agency Address: 5900 Landerbrook DR. Ste. 300

Agency City,St,Zip: Cleveland 44124

Agency Contact: Cliff Petriella

Agency Telephone: 4404603727

Agency Type: Private

SIC Code: 3573

SIC Code 2: Not reported

Primary Waste: Contaminated Ground Water

Primary Waste Type: Hazardous/Influent or Solid Wastes that contain toxic, corrosive, ignitable or reactive substances and must be managed according to applicable DOHS standards.

Secondary Waste: Not reported

Secondary Waste Type: Not reported

Design Flow: 0

Baseline Flow: 0

Reclamation: No reclamation requirements associated with this facility.

POTW: The facility is not a POTW.

Treat To Water: Moderate Threat to Water Quality. A violation could have a major adverse impact on receiving biota, can cause aesthetic impairment to a significant human population, or render unusable a potential domestic or municipal water supply. Awsthetic impairment would include nuisance from a waste treatment facility.

Complexity: Category B - Any facility having a physical, chemical, or biological waste treatment system (except for septic systems with subsurface disposal), or any Class II or III disposal site, or facilities without treatment systems that are complex, such as marinas with petroleum products, solid wastes, and sewage pump out facilities.

Completed Sub Area Name: Not reported
Completed Document Type: Removal Action Completion Report
Completed Date: 2002-10-24 00:00:00
Comments: Completed Remedial Action. Ten dual-phase (vapor and groundwater) extraction wells behind the onsite buildings, and four extraction wells downgradient at the northern boundary of the adjacent TRW/Vidar Site (77 Ortega Drive) were installed. The new extraction wells were connected to the existing treatment system at the Site.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Remedial Action Completion Report
Completed Date: 2000-02-07 00:00:00
Comments: Completed RA. Soil vapor extraction (SVE) and air inlet wells were abandoned. 600 cubic yards of soil was excavated in the former SVE area, aerated and redeposited.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Operations and Maintenance Manual
Completed Date: 1997-04-15 00:00:00
Comments: Amended Operation and Maintenance Plan for air stripper

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Design/Implementation Workplan
Completed Date: 1996-09-12 00:00:00
Comments: Approved design for horizontal extraction wells to enhance the existing remedial system. The design was not implemented due to access issues.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Removal Action Completion Report
Completed Date: 1993-11-16 00:00:00
Comments: Completed RA. Groundwater extraction at Well T-6 by the existing remedial system was stopped due to detection of dense non-aqueous phase liquid (DNAPL) of trichloroethylene. The DNAPL was pumped and collected in a baker tank and treated onsite.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Remedial Action Completion Report
Completed Date: 1993-06-24 00:00:00
Comments: Completed RA. Soil vapor extraction/treatment and groundwater extraction/treatment system constructed with three groundwater extraction wells, and 34 soil vapor extraction and 25 air inlet wells

were installed. Soil vapor was treated using carbon absorption. Groundwater was treated using ultra violet light/hydrogen peroxide. The units were constructed inside the building at 2296 Mora Drive and include a volatile organic compound and water separator unit, a UV/peroxide unit, and a liquid carbon absorption unit. Treated water is discharged to the sanitary sewer under permit from the City of Mountain View or to the storm drain under a permit from the Regional Water Quality Control Board.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Remedial Action Completion Report
Completed Date: 1991-10-25 00:00:00
Comments: Completed RA. Five concrete underground tanks (A,B,C,D and F) were removed from a location behind the commercial buildings located at 2274-2296 Mora Drive. Tank E was removed in August 1989. The excavated pits were backfilled with clean fill approximately 455 cubic yards of soil were removed, aerated and disposed offsite. A soil vapor extraction system was installed to remediate the remaining volatile organic compounds in soil in other site areas. Initiated August 17, 1991 and completed October 25, 1991.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Preliminary Assessment Report
Completed Date: 1985-12-01 00:00:00
Comments: Completed PA. In January 1982, samples were collected from standing water in two of the tanks and the results detected perchloroethylene (PCE), chromium, and xylene. Investigations were conducted to delineate the lateral extent of the soil and groundwater contamination originating from releases at the tanks. Trichloroethylene (TCE), PCE, dichloroethylene (DCE), benzene, toluene, xylene and ethylbenzene were detected in the groundwater. These chemicals and chromium were also detected in the soils near the tanks.

Completed Sub Area Name: Not reported
Completed Document Type: Design/Implementation Workplan
Completed Date: 1996-09-12 00:00:00
Comments: Approved design for horizontal extraction wells to enhance the existing remedial system. The design was not implemented due to access issues.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Removal Action Completion Report
Completed Date: 1993-11-16 00:00:00
Comments: Completed RA. Groundwater extraction at Well T-6 by the existing remedial system was stopped due to detection of dense non-aqueous phase liquid (DNAPL) of trichloroethylene. The DNAPL was pumped and collected in a baker tank and treated onsite.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Remedial Action Completion Report
Completed Date: 1993-06-24 00:00:00
Comments: Completed RA. Soil vapor extraction/treatment and groundwater extraction/treatment system constructed with three groundwater extraction wells, and 34 soil vapor extraction and 25 air inlet wells were installed. Soil vapor was treated using carbon absorption. Groundwater was treated using ultra violet light/hydrogen peroxide. The units were constructed inside the building at 2296 Mora Drive and include a volatile organic compound and water separator unit, a UV/peroxide unit, and a liquid carbon absorption unit. Treated water is discharged to the sanitary sewer under permit from the City of Mountain View or to the storm drain under a permit from the Regional Water Quality Control Board.

Comments: Remedial Design for SVE enhancement. Horizontal wells constructed in source area and connected to the existing SVE and treatment system.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Preliminary Assessment Report
Completed Date: 1985-12-01 00:00:00
Comments: Completed PA. In January 1982, samples were collected from standing water in two of the tanks and the results detected perchloroethylene (PCE), chromium, and xylene. Investigations were conducted to delineate the lateral extent of the soil and groundwater contamination originating from releases at the tanks. Trichloroethylene (TCE), PCE, dichloroethylene (DCE), benzene, toluene, xylene and ethylbenzene were detected in the groundwater. These chemicals and chromium were also detected in the soils near the tanks.

from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Completed Info:

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Remedial Investigation / Feasibility Study
Completed Date: 2001-06-29 00:00:00
Comments: Completed RIFS. The results did not indicate a groundwater contamination source on the property.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Removal Action Completion Report
Completed Date: 1995-01-10 00:00:00
Comments: Completed RA. Approximately 1.5 cubic yards of soil was excavated and disposed off-site. The building was steam cleaned. In addition, 3 cubic yards of ground concrete was disposed off-site as part of the removal of the concrete sump and clarifer.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Preliminary Endangerment Assessment Report
Completed Date: 1992-11-13 00:00:00
Comments: Approved PEA. Shallow soil samples showed copper as high as 7,900 ppm and lead as high as 2,000 ppm. Other metal contaminants were also found in soil along with tetrachloroethylene as high as 940 ppm, and 1,1,1-TCA as high as 440 ppm. Although Symtron is located in an area known to have groundwater problems, no groundwater investigation was conducted.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Site Screening
Completed Date: 1991-09-24 00:00:00
Comments: Completed Site Screening. Copper, lead and volatile organics have been detected in the soil. Site referred to DTSC by Mountain View Fire Department. 2227 Mora Drive address housed Symtron's hazardous materials storage area where acids, bases, oxidizers, & flammable liquids, as well as copper animated plates, were kept. 2235 Mora housed offices, photo darkroom, wet and dry quality control labs, and process operations. 2245 Mora operations included copper etching and black oxide operations & clean rooms used for Symtron's dry process. Symtron operated an onsite waste water treatment plant. Treated waste water and effluent went directly to the Mountain View sewer via an inground sump which served as a final clarifier. Closure sampling was conducted in March 1991 and included soil concrete chip, and wipe samples. Copper was detected as high as 7,900 ppm and 1,600 ppm in soil and concrete chip samples respectively. Lead was detected as high as 1,000 ppm in soil. Volatile organic compounds (VOCs) all tested below 1 ppm.

Facility name: SHELL SERVICE STATION
Classification: Small Quantity Generator

Hazardous Waste Summary:

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Violation Status: No violations found

Registry ID: 110002670547

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Federal Delisted NPL site list

DELISTED NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Federal CERCLIS list

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site List

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifies sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Included in the listing are brownfields properties addresses by Cooperative Agreement Recipients and brownfields properties addressed by Targeted Brownfields Assessments. Targeted Brownfields Assessments-EPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities--especially those without EPA Brownfields Assessment Demonstration Pilots--minimize the uncertainties of contamination often associated with brownfields. Under the TBA program, EPA provides funding and/or technical assistance for environmental assessments at brownfields sites throughout the country. Targeted Brownfields Assessments supplement and work with other efforts under EPA's Brownfields Initiative to promote cleanup and redevelopment of brownfields. Cooperative Agreement Recipients--States, political subdivisions, territories, and Indian tribes become Brownfields Cleanup Revolving Loan Fund (BCRLF) cooperative agreement recipients when they enter into BCRLF cooperative agreements with the U.S. EPA. EPA selects BCRLF cooperative agreement recipients based on a proposal and application process. BCRLF cooperative agreement recipients must use EPA funds provided through BCRLF cooperative agreement for specified brownfields-related cleanup activities.

Local Lists of Hazardous waste / Contaminated Sites

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

Date of Government Version: 02/02/2011	Source: Drug Enforcement Administration
Date Data Arrived at EDR: 03/17/2011	Telephone: 202-307-1000

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

Other Ascertainable Records

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

RCRA-NonGen: RCRA - Non Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006	Source: Environmental Protection Agency

	Data Release Frequency: Quarterly

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method.

Date of Government Version: 12/31/2009	Source: California Environmental Protection Agency

EDR PROPRIETARY RECORDS

EDR Proprietary Records

Manufactured Gas Plants: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Historical Auto Stations: EDR Proprietary Historic Gas Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

Electric Power Transmission Line Data

Source: Rextag Strategies Corp.

Telephone: (281) 769-2247

U.S. Electric Transmission and Power Plants Systems Digital GIS Data

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

Source: American Hospital Association, Inc.

Telephone: 312-280-5991

The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing

Source: Centers for Medicare & Medicaid Services

Telephone: 410-786-3000

A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes

Source: National Institutes of Health

Telephone: 301-594-6248

Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools

Source: National Center for Education Statistics

Telephone: 202-502-7300

The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools

Source: National Center for Education Statistics

Telephone: 202-502-7300

The National Center for Education Statistics' primary database on private school locations in the United States.

Most Recent Revision:	1999

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General NNE

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

<u>Target Property County</u> SANTA CLARA, CA	FEMA Flood <u>Electronic Data</u> YES - refer to the Overview Map and Detail Map
--	--

Flood Plain Panel at Target Property: 06085C - FEMA DFIRM Flood data

Additional Panels in search area: Not Reported

NATIONAL WETLAND INVENTORY

<u>NWI Quad at Target Property</u> MOUNTAIN VIEW	NWI Electronic <u>Data Coverage</u> YES - refer to the Overview Map and Detail Map
---	--

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data:*

Search Radius:	1.25 miles
Location Relative to TP:	1 - 2 Miles ENE
Site Name:	Sierra Vista Properties
Site EPA ID Number:	CAD982400285
Surficial Aquifer Flow Dir.:	NOT AVAILABLE.
Measured Depth to Water:	12 feet.
Hydraulic Connection:	The surficial aquifer is confined and separated from the lower aquifer by an aquitard. However, the surficial and lower aquifers are interconnected within 1 mile southwest of the site.
Sole Source Aquifer:	No information about a sole source aquifer is available
Data Quality:	Information based on site-specific subsurface investigations is documented in the CERCLIS investigation report(s)

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

<u>MAP ID</u>	<u>LOCATION FROM TP</u>	<u>GENERAL DIRECTION GROUNDWATER FLOW</u>

All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

<u>MAP ID</u>	<u>LOCATION FROM TP</u>	<u>GENERAL DIRECTION GROUNDWATER FLOW</u>
18	1/2 - 1 Mile ESE	NE

For additional site information, refer to Physical Setting Source Map Findings.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

Era: Cenozoic
System: Quaternary
Series: Quaternary
Code: Q (*decoded above as Era, System & Series*)

GEOLOGIC AGE IDENTIFICATION

Category: Stratified Sequence

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name: BOTELLA

Soil Surface Texture: clay loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Not reported

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: MODERATE

Depth to Bedrock Min: > 60 inches

Depth to Bedrock Max: > 60 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Layer	Boundary		Soil Texture Class	Classification		Permeability Rate (in/hr)	Soil Reaction (pH)
	Upper	Lower		AASHTO Group	Unified Soil		
1	0 inches	9 inches	clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay Soils.	Max: 0.60 Min: 0.20	Max: 7.30 Min: 5.60
2	9 inches	41 inches	silty clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay Soils.	Max: 0.60 Min: 0.20	Max: 7.80 Min: 5.60
3	41 inches	76 inches	sandy clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand.	Max: 0.60 Min: 0.20	Max: 7.80 Min: 5.60

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures: No Other Soil Types

Surficial Soil Types: No Other Soil Types

Shallow Soil Types: No Other Soil Types

Deeper Soil Types: No Other Soil Types

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)

Source: United States Geologic Survey

EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Scanned Digital USGS 7.5' Topographic Map (DRG)

Source: United States Geologic Survey

A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2011 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 and 2005 from the U.S. Fish and Wildlife Service.

HYDROGEOLOGIC INFORMATION

AQUIFLOW^R Information System

Source: EDR proprietary database of groundwater flow information

EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit

Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database

Source: Department of Agriculture, Natural Resources Conservation Services

The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database

Source: Department of Agriculture, Natural Resources Conservation Services (NRCS)

Telephone: 800-672-5559

SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Services, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

The EDR Aerial Photo Decade Package

EDR Aerial Photo Decade Package

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

When delivered electronically by EDR, the aerial photo images included with this report are for ONE TIME USE ONLY. Further reproduction of these aerial photo images is prohibited without permission from EDR. For more information contact your EDR Account Executive.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1922 through 2006. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

EDR Historical Topographic Map Report

EDR Historical Topographic Map Report

Environmental Data Resources, Inc.s (EDR) Historical Topographic Map Report is designed to assist professionals in evaluating potential liability on a target property resulting from past activities. EDRs Historical Topographic Map Report includes a search of a collection of public and private color historical topographic maps, dating back to the early 1900s.

Thank you for your business.

Environmental Lien Search and Activity Use Limitations

San Antonio Center North
405 South San Antonio Road
Mountain View, CA 94040

Inquiry Number: 3146300.7
August 16, 2011

The EDR Environmental LienSearch™ Report

The EDR Environmental LienSearch™ Report

The EDR Environmental LienSearch Report provides results from a search of available current land title records for environmental cleanup liens and other activity and use limitations, such as engineering controls and institutional controls.

A network of professional, trained researchers, following established procedures, uses client supplied address information to:

- search for parcel information and/or legal description;
- search for ownership information;
- research official land title documents recorded at jurisdictional agencies such as recorders' offices, registries of deeds, county clerks' offices, etc.;
- access a copy of the deed;
- search for environmental encumbering instrument(s) associated with the deed;
- provide a copy of any environmental encumbrance(s) based upon a review of key words in the instrument(s) (title, parties involved, and description); and
- provide a copy of the deed or cite documents reviewed.

Thank you for your business.

Please contact EDR at 1-800-352-0050
with any questions or comments.

EXHIBIT B

The land referred to in this Report is situated in the County of Santa Clara, City of Mountain View,
State of California, and is described as follows:

PARCEL ONE:

Beginning at an iron pipe set at the point of intersection of the Southeasterly line of San Antonio Avenue (50.00 feet in width) with the Southeasterly prolongation of the center line of Miller Avenue; thence South 25° 36' West along said Southeasterly line of San Antonio Avenue 4.15 feet to an iron pipe set at the Northernmost corner of Lot 3, as said lot is shown upon the map hereinafter referred to; thence South 64° 17' 58" East along a Northeasterly line of said Lot 3, for a distance of 200.00 feet to a PK Nail in concrete base of fence post and the true point of beginning of the parcel of land to be described; thence from said true point of beginning of the parcel of land to be described; thence from said true point of beginning South 56° 43' 04" East along a line which is drawn at right angles to the Southeasterly line of Lot 4, as said lot is shown upon the map hereinafter referred to, for a distance of 457.69 feet to a point on said Southeasterly line of Lot 4; thence North 33° 16' 56" East along said last named line 424.09 feet to an iron pipe set at the Easternmost corner of said Lot 4; thence North 64° 17' 58" West along the Northeasterly line of said Lot 4, for a distance of 710.28 feet to an iron pipe set at the Northernmost corner of said Lot 4 on said Southeasterly line of San Antonio Avenue; thence South 25° 36' West along said Southeasterly line of San Antonio Avenue 40.00 feet to an iron pipe set at the Westernmost corner of said Lot 4; thence along the general westerly line of said Lot 4, for the following courses and distances: South 64° 17' 58" East 300.00 feet to an iron pipe, South 25° 36' West 100.00 feet to an iron pipe, North 64° 17' 58" West 100.00 feet to an iron pipe and South 25° 36' West 148.21 feet to the Northwesternly common corner for said Lots 3 and 4; thence South 25° 36' West along a Northwesternly line of said Lot 3, for a distance of 71.79 feet to the true point of beginning, a portion of Lots 3 and 4; as said lots are shown upon that certain map entitled "Record of Survey property of Thoits Bros. Inc., Edward D. Thoits, Trustee and Warren R. Thoits, Trustee being a portion of the Rancho Rincon De San Francisquito in the City of Mountain View, Santa Clara County, California" which map was filed for record on February 4, 1957 in Book 78 of Maps, page 20.

PARCEL TWO:

A non-exclusive easement and right of way for the passage, ingress and egress of motor vehicles and pedestrians over that certain strip of land 30 feet wide and lying 15 feet either side measured at right angles to the following described center line:

PRIVATE RIGHT OF WAY

Commencing on the Easterly sideline of San Antonio Avenue at the most Northerly

corner of the 12 1/2 acre parcel described as Parcel 2 in the Deed from Alice F. Maxwell to E.C. Thoits et al, dated January 22, 1949 and recorded January 26, 1949 in Book 1437 of Official Records, page 233, Santa Clara County Records; thence along the Northeasterly boundary of said 12 1/2 acre parcel, South 64° 17' 58" East 315 feet; thence South 25° 36' West and parallel to the Easterly sideline of San Antonio Avenue 143.26 feet; thence South 50° 21' 41" West 49.81 feet; thence South 33° 16' 56" West to the point of intersection with the Southwesterly boundary of the above described Parcel One which said point of intersection is the true point of beginning of this description; thence South 33° 16' 56" West and parallel to the Southeasterly boundary of the aforementioned 12 1/2 acre parcel of land distant therefrom measured at right angles 387.30 feet to a point that lies 15 feet Southwesterly measured at right angles to the common boundary between Lots No. 1 and No. 2 as shown upon that certain Record of Survey Map filed February 4, 1957 in Book 78 of Maps, page 20, Santa Clara County Records.

Excepting therefrom that portion of said private right of way lying within the boundaries of that certain 1.089 parcel of land particularly described as follows:

Beginning at an iron pipe set on the Southeasterly line of San Antonio Avenue (50.00 feet in width) distant thereon South 25° 36' West 518.52 feet from an iron pipe set at the point of intersection thereof with the Southeasterly prolongation of the center line of Miller Avenue and from which point of beginning a concrete monument bears South 69° 43' 23" East 0.27 feet; thence from said point of beginning South 25° 36' West along said Southeasterly line of San Antonio Avenue 100.00 feet to an iron pipe; thence at right angles South 64° 24' East 400.00 feet; thence at right angles North 25° 36' East 137.27 feet to a point which bears South 69° 43' 23" East from the point of beginning; thence North 69° 43' 23" West 401.73 feet to the point of beginning.

PARCEL THREE:

A non-exclusive easement for the parking of motor vehicles upon the following described parcels of land:

PARKING AREA 1

Commencing at the point of intersection of the Northeasterly line of the San Francisco-San Jose Road (state highway) now known as El Camino Real as said line was established by the deed from Nellie Riccomi, also known as Nellie F. Riccomi, a widow, to the State of California, dated December 11, 1929, recorded January 16, 1930 in Book 491 of Official Records, page 562, Santa Clara County Records; with the Southeasterly line of that certain 12.45 acre tract of land described as Parcel One in the deed from Alice F. Maxwell to E.C. Thoits et al, dated January 22, 1949, recorded January 26, 1949 in Book 1737 Official Records, page 233, Santa Clara County Records, running thence North 56° 12' 02" West

along the said Northeasterly line of San Francisco- San Jose Road 239.79 feet to the true point of beginning, thence continuing along the Northeasterly line of the San Francisco-San Jose Road North 56° 12' 02" West 123.92 feet; thence on a curve to the right with a radius of 75 feet from a tangent to the last named course through a central angle of 81° 48' 02" and a curve length of 107.08 feet; thence on a line parallel to the center line of San Antonio Avenue and distant therefrom 60 feet, measured at right angles, North 23° 36' East 382.17 feet; thence South 56° 43' 04" East, and parallel to the Northeasterly sideline of Lot 1, as shown on that Record of Survey Map filed in Book 78 of Maps, page 20 in the office of the Recorder of the County of Santa Clara, 248.64 feet; thence South 33° 16' 56" West and parallel to the Southeasterly sideline of the aforementioned 12.45 acre parcel, 444.84 feet, more or less, to the true point of beginning.

PARKING AREA 2

Commencing at a point in the Southeasterly sideline of San Antonio Avenue, which point lies South 25° 36' West and along said Southeasterly sideline, 4.15 feet from the intersection of the prolongation Southeasterly of the centerline of Miller Avenue with the aforesaid Southeasterly sideline of San Antonio Avenue as said point and intersection are shown on that certain Record of Survey Map recorded in Book 78 of Maps, page 20, Santa Clara County Records, and which point also lies South 25° 36' West and along the aforesaid Southeasterly sideline of San Antonio Avenue 360 feet from the Northernmost corner of that certain 12 1/2 acre tract of land described as Parcel 2 in the Deed from Alice F. Maxwell to E.C. Thoits et al, dated January 22, 1949 and recorded January 26, 1949 in Book 1737 Official Records, page 233, Santa Clara County Records; running thence South 64° 17' 58" East and parallel with the Northeasterly line of said 12 1/2 acre tract 35 feet to the true point of beginning; thence continuing along the same line South 64° 17' 58" East 165 feet; thence South 56° 43' 04" East 55.39 feet; thence South 33° 16' 56" West and parallel to the Southeasterly boundary of said 12 1/2 acre tract, 966.42 feet; thence North 56° 43' 04" West 91.53 feet; thence along a line parallel to the center line of San Antonio Avenue and distant therefrom 60 feet, measured at right angles North 25° 36' East 953.21 feet to the true point of beginning.

EXCEPTING THEREFROM that portion of said private right of way lying within the boundaries of that certain 1.089 parcel of land particularly described as follows:

Beginning at an iron pipe set on the Southeasterly line of San Antonio Avenue (50.00 feet in width) distant thereon South 25° 36' West 518.52 feet from an iron pipe set at the point of intersection thereof with the Southeasterly prolongation of the center line of Miller Avenue and from which point of beginning a concrete monument bears South 69° 43' 23" East 0.27 feet; thence from said point of beginning South 25° 36' West along said Southeasterly line of San Antonio Avenue, 100.00 feet to an iron pipe; thence at right angles South

64° 24' East 400.00 feet; thence at right angles North 25° 36' East 137.27 feet
to a point which bears South 69° 43' 23" East from the point of beginning;
thence North 69° 43' 23" West 401.73 feet to the point of beginning.

The EDR Property Tax Map Report

EDR Property Tax Map Report

Environmental Data Resources, Inc.'s EDR Property Tax Map Report is designed to assist environmental professionals in evaluating potential environmental conditions on a target property by understanding property boundaries and other characteristics. The report includes a search of available property tax maps, which include information on boundaries for the target property and neighboring properties, addresses, parcel identification numbers, as well as other data typically used in property location and identification.

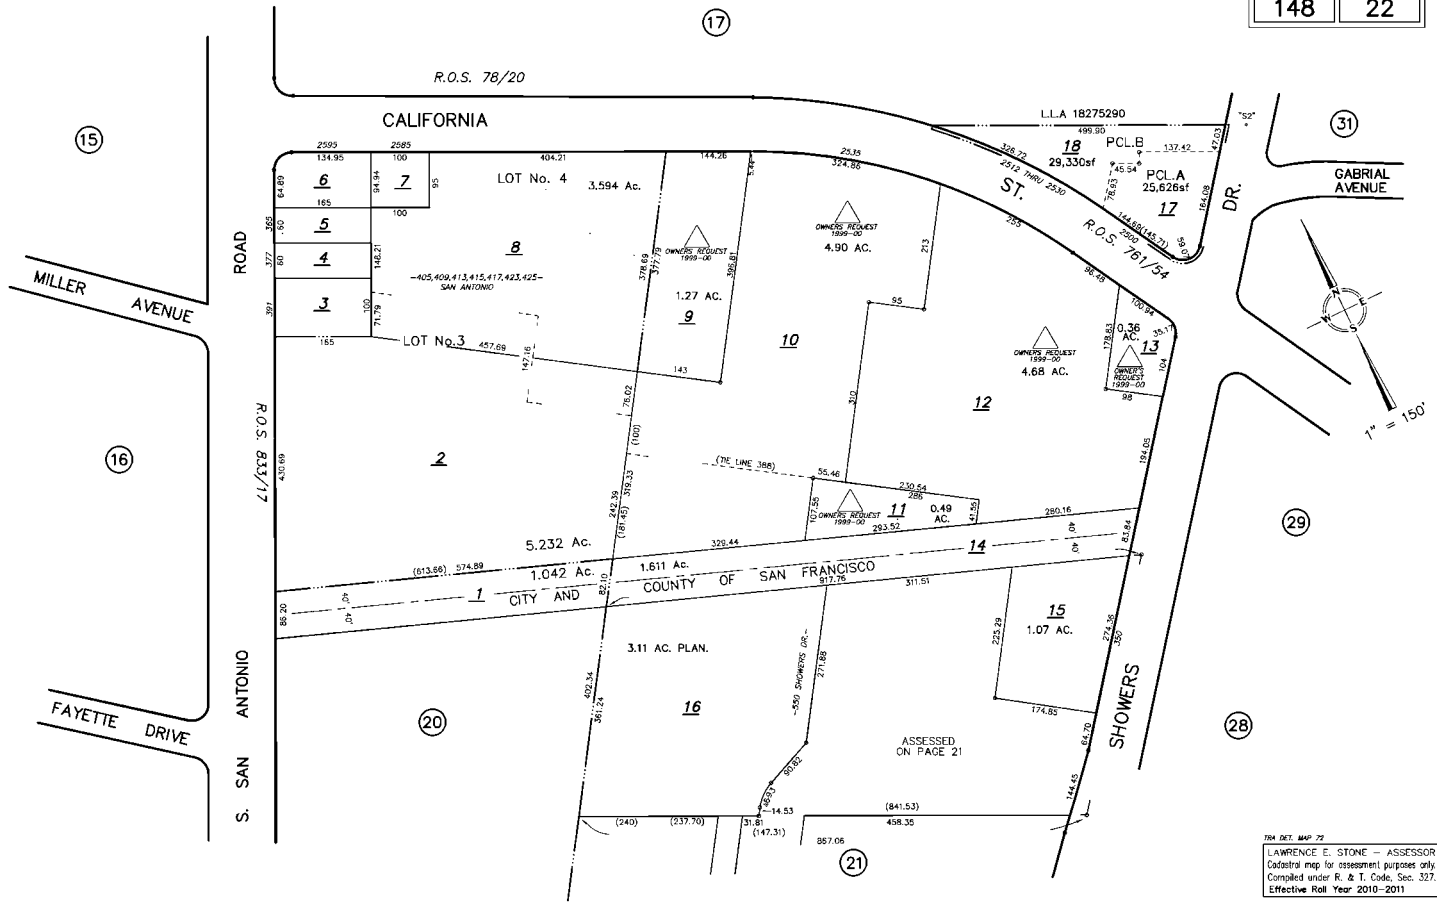

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

Disclaimer - Copyright and Trademark Notice

This Report contains certain information obtained from a variety of public and other sources reasonably available to Environmental Data Resources, Inc. It cannot be concluded from this Report that coverage information for the target and surrounding properties does not exist from other sources. **NO WARRANTY EXPRESSED OR IMPLIED, IS MADE WHATSOEVER IN CONNECTION WITH THIS REPORT. ENVIRONMENTAL DATA RESOURCES, INC. SPECIFICALLY DISCLAIMS THE MAKING OF ANY SUCH WARRANTIES, INCLUDING WITHOUT LIMITATION, MERCHANTABILITY OR FITNESS FOR A PARTICULAR USE OR PURPOSE. ALL RISK IS ASSUMED BY THE USER. IN NO EVENT SHALL ENVIRONMENTAL DATA RESOURCES, INC. BE LIABLE TO ANYONE, WHETHER ARISING OUT OF ERRORS OR OMISSIONS, NEGLIGENCE, ACCIDENT OR ANY OTHER CAUSE, FOR ANY LOSS OR DAMAGE, INCLUDING, WITHOUT LIMITATION, SPECIAL, INCIDENTAL, CONSEQUENTIAL, OR EXEMPLARY DAMAGES. ANY LIABILITY ON THE PART OF ENVIRONMENTAL DATA RESOURCES, INC. IS STRICTLY LIMITED TO A REFUND OF THE AMOUNT PAID FOR THIS REPORT.** Purchaser accepts this Report "AS IS". Any analyses, estimates, ratings, environmental risk levels or risk codes provided in this Report are provided for illustrative purposes only, and are not intended to provide, nor should they be interpreted as providing any facts regarding, or prediction or forecast of, any environmental risk for any property. Only a Phase I Environmental Site Assessment performed by an environmental professional can provide information regarding the environmental risk for any property. Additionally, the information provided in this Report is not to be construed as legal advice.

RE: **Phase I Environmental Site Assessment Report**
San Antonio Center
405-423 San Antonio Road
Mountain View, California 94041

LAC Project No. 05-32947.1

Dear Mr. Losada:

LandAmerica Assessment Corporation (LAC) is pleased to provide the results of our Phase 1 Environmental Site Assessment of the San Antonio Center located at 405-423 San Antonio Road, Mountain View, California . This assessment was authorized and performed in general accordance with the requirements of ASTM Standard E 1527-00 and the Goldman Sachs Commercial Mortgage Capital, L.P. Scope of Work.

This assessment included a site reconnaissance as well as research and interviews with representatives of the public, property management, and regulatory agencies. An assessment was made, conclusions stated, and recommendations outlined.

We appreciate the opportunity to provide environmental services to Goldman Sachs Commercial Mortgage Capital, L.P. If you have any questions concerning this report, or if we can assist you in any other matter, please contact M. Evans Howell at (214) 987-9982 or via email at ehowell@landam.com.

Very Truly Yours,

LANDAMERICA ASSESSMENT CORPORATION

EXECUTIVE SUMMARY

LandAmerica Assessment Corporation (LAC) has performed a Phase I Environmental Site Assessment (ESA) in general accordance with ASTM 1527-00 for the San Antonio Center located at 405-423 San Antonio Road, Mountain View, California (the "Property").

The Phase I ESA is designed to provide Goldman Sachs Commercial Mortgage Capital, L.P. with an assessment concerning environmental conditions (limited to those issues identified in the report) as they exist at the Property. This assessment was conducted utilizing generally accepted ESA industry standards in accordance with ASTM E 1527-00, Standard Practice for ESAs: Phase I ESA Process.

The Property is currently developed for retail and commercial use. The building contains four commercial tenants, including a Ross Store, Beverage and More, Fantastic Salon and Kumon Reading Center.

The Property is situated within an urban area in downtown Mountain View, California. The subject building is bound to the north by commercial offices, restaurants and grocery stores; to the east by California Avenue, beyond which is a Safeway grocery store; to the south by Joann's Fabrics, and beyond by the San Antonio Shopping Center; and to the west by a Sears Auto Center beyond which is the San Antonio Shopping Center. Based upon topographic map interpretation and site observations, groundwater flow beneath the site is inferred to be in a northeast direction toward the San Francisco Bay. This site was developed in 1960, on lands formerly used for residential and agricultural purposes.

LAC obtained and reviewed a database report from Environmental Data Resources (EDR) for the Property and the surrounding area. Based on the database report, no up gradient sites were identified as potential concerns to the Property. LAC did identify sixteen leaking UST (LUST) sites located within the prescribed search radii. All of the sites identified were either cross or down gradient of the Property, affected soil only, and/or have been granted a case closed status, or sufficiently distant, and are therefore not considered Recognized Environmental Conditions (RECs).

Conclusions

LAC has performed a Phase I ESA in conformance with the scope and limitations of ASTM Practice E 1527-00 of 405-423 San Antonio Road, Mountain View, California, the Property. Any exceptions to or deletions from this practice are described in Section 1.4 of this report.

This assessment has revealed no evidence of recognized environmental conditions in connection with the Property.

Recommendations

Based on the information available at the time of this assessment, LAC does not recommend further investigation of the Property at this time.

The following table summarizes the findings of the significant elements of this investigation.

Assessment Component	Acceptable	Routine Solution	Phase II	Estimated Cost	Reference Section
Historical Review	X				3.3
On-site Operations	X				4.2
Hazardous Materials	X				4.2.1
Waste Generation	X				4.2.1
PCBs	X				4.2.3
Asbestos	X				4.2.10
Lead in Drinking Water	X				4.2.8
Storage Tanks	X				4.2.6
Surface Areas	X				4.2.2
Regulatory Database Review	X				3.1
Adjoining Properties	X				2.6, 3.4
Other	X				NA

1.0 INTRODUCTION

LandAmerica Assessment Corporation (LAC) was retained by Goldman Sachs Commercial Mortgage Capital, L.P. to conduct a Phase I Environmental Site Assessment (ESA) of the San Antonio Center located at 405-423 San Antonio Road, Mountain View, California (the "Property"). The protocol used for this assessment is in general conformance with ASTM E 1527-00, Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process and the Goldman Sachs Commercial Mortgage Scope of Work.

On November 21, 2005, John Geare, a representative of LAC, conducted a site reconnaissance to assess the possible presence of petroleum products and hazardous materials at the Property. LAC's investigation also included review of aerial photos, reconnaissance of adjacent properties, background research, and review of available local, state, and federal regulatory records regarding the presence of petroleum products and/or hazardous materials at the Property.

LAC contracted Environmental Data Resources Inc. (EDR) of Milford, Connecticut, to perform a computer database search for local, state, and Federal regulatory records pertaining to environmental concerns for the Property and properties in the vicinity of the Property (see Section 3.0).

1.1 Purpose

The purpose of this Phase I Environmental Site Assessment (ESA) was to identify existing or potential Recognized Environmental Conditions (as defined by ASTM Standard E-1527-00) in connection with the Property. LAC understands that the findings of this study will be used by Goldman Sachs Commercial Mortgage Capital, L.P. to evaluate a pending financial transaction in connection with the Property.

1.2 Scope of Services

The scope of work for this ESA is in general accordance with the requirements of ASTM Standard E 1527-00. LAC warrants that the findings and conclusions contained herein were accomplished in accordance with the methodologies set forth in the Scope of Work. These methodologies are described as representing good commercial and customary practice for conducting an ESA of a property for the purpose of identifying recognized environmental conditions. No other warranties are implied or expressed.

1.3 Assumptions

There is a possibility that even with the proper application of these methodologies there may exist on the Property conditions that could not be identified within the scope of the assessment or which were not reasonably identifiable from the available information. LAC believes that the information obtained from the record review and the interviews concerning the site is reliable. However, LAC cannot and does not warrant or guarantee that the information provided by these other sources is accurate or complete. The methodologies of this assessment are not intended to produce all inclusive or comprehensive results, but rather to provide Goldman Sachs Commercial Mortgage Capital, L.P. with information relating to the Property.

1.4 Limitations and Exceptions

The findings and conclusions contain all of the limitations inherent in these methodologies that are referred to in ASTM 1527-00.

1.5 Special Terms and Conditions

The conclusions and findings set forth in this report are strictly limited in time and scope to the date of the evaluations. The conclusions presented in the report are based solely on the services described therein, and not on scientific tasks or procedures beyond the scope of agreed-upon services or the time and budgeting restraints imposed by the client. No subsurface exploratory drilling or sampling was done under the scope of this work. Unless specifically stated otherwise in the report, no chemical analyses have been performed during the course of this ESA.

Some of the information provided in this report is based upon personal interviews, and research of available documents, records, and maps held by the appropriate government and private agencies. This is subject to the limitations of historical documentation, availability, and accuracy of pertinent records, and the personal recollections of those persons contacted.

1.6 Use Reliance

This report is for the use and benefit of, and may be relied upon by Goldman Sachs Commercial Mortgage Capital, L.P., Goldman Sachs & Co., Goldman Sachs Mortgage Company or any of its affiliates and the agents and advisors, initial and subsequent holders from time to time of any debt and/ or debt securities secured, directly and indirectly, by any participation interest in any such debt, and indenture trustee, servicer or other agent acting on behalf of such holders of such debt securities; any rating agencies; and the institutional provider(s) from time to time of any liquidity facility or credit support for such financings, and their respective successors and assigns.

In addition, this report or a reference to this report, may be included or quoted in any offering circular, registration statement, prospectus or sales brochure (in either electronic or hard copy format) in connection with a securitization or transaction involving such debt and or debt securities.

2.0 SITE DESCRIPTION

2.1 User Provided Information

Pursuant to ASTM E 1527-00, LAC requested the following site information from Goldman Sachs Commercial Mortgage Capital, L.P. (User of this report) and from the site contact.

ITEM	PROVIDED BY USER	NOT PROVIDED BY USER	DISCUSSED BELOW	DOES NOT APPLY
2.1.1 Environmental Pre-survey Questionnaire		X		
2.1.2 Title Records		X		
2.1.3 Environmental Liens or Activity and Use Limitation		X		
2.1.4 Specialized Knowledge		X		
2.1.5 Valuation Reduction for Environmental Issues		X		
2.1.6 Identification of Key Site Manager	X			
2.1.7 Reason for Performing Phase 1 ESA	Yes See Section 1.1			
2.1.8 Prior Environmental Reports		X		
2.1.9 Other				X

2.2 Location and Legal Description

The address of the Property is 405-423 San Antonio Road, Mountain View, California 94041. The Property is located in a residential and commercial area of Santa Clara County. According to The Santa Clara County Assessor's offices, the assessor's parcel number of the Property is 147-45-016. The abbreviated legal description is reproduced below:

"lot 16, in the City of Mountain View, County of Santa Clara, State of California, as per map filed in book 147, page 45 of maps filed in the office of the Santa Clara County recorder. "

According to the Santa Clara County Tax Assessor's office the Property is currently owned by Ken, Robert, John and James Machado, Cheri Knap and Cary Bashnik, who have owned the Property since 1997.

2.3 Site and Vicinity General Characteristics

The Property is located in a mixed use area that is characterized by retail and commercial businesses and residential development. The Property is zoned Regional Commercial District, by the City of Mountain View.

The Property consists of a square-shaped parcel approximately 3.54 acres in size. The Property is designed and used for retail and office purposes. Currently, the Property is developed with one structure that was constructed in 1960. The structure at the Property

is single story, and comprises a total of 45,500 square feet of building space. The structure offers a total of four tenant spaces.

2.4 Current Use of the Property

At the present time, the Property is developed with a commercial and retail structure, parking area and landscaped areas. The site consists of one, one-story building and paved parking areas.

According to the City of Mountain View, the Property is zoned Regional Commercial District. The occupancy at the time of the site reconnaissance was reported to be 100 % percent. Based on the information reviewed during the preparation of this report and the observations made during the reconnaissance of the Property, the tenant spaces are currently occupied by the tenants and activities identified in the table below:

SITE OCCUPANTS		
UNIT	TENANT	OPERATION
405	Ross Dress for Less	Retail clothes
417	Fantastic Salon	Beauty Salon
419	Kumon Reading	Reading clinic
423	Beverages and More	Retail beverages

2.5 Description of Site Improvements

The building is of concrete slab-on-grade foundation with wood frame construction, and has interior square footage of 45,500 square feet. The wood frame walls have exterior stucco surfacing, with interior finishes comprised of 2’x2’ acoustical ceiling panels and gypsum wallboard interior walls. Carpeting and resilient floor tile covers the majority of interior floors, with ceramic tiles present in restrooms. Tar and gravel cover the building roof.

Review of permits maintained at the Mountain View Building Department indicates that significant renovations of the building took place in 1996 and 1976 (Section 3.1.2.3). This review noted smaller renovations in the 1970s and 1980s.

The City of Mountain View supplies drinking water to the Property from the municipal distribution system. Sanitary discharges on the subject site are discharged into the municipal sanitary sewer system. The subject site area is serviced by the Santa Clara County Treatment Plant. No clarifier or other wastewater treatment system is on-site. Electricity and natural gas are provided to the site by Pacific Gas and Electric.

2.6 Current Use of Adjoining Properties

During the vicinity reconnaissance, LAC observed the following land use on properties in the immediate vicinity of the Property.

North: Areas immediately adjacent to the north include a multi-tenant office building (365,377 and 391 San Antonio Avenue and 2595 California), with San Antonio Avenue beyond and the Milk Pail Market (2585 California Street).

South: Areas immediately adjacent to the south include Joann’s Fabrics (435 San Antonio Avenue), with the San Antonio Shopping Center beyond.

East: Areas immediately adjacent to the east include a parking lot, California Avenue, with a Safeway store beyond (2580 California Avenue).

West: Areas immediately adjacent to the west include a Sears Auto Service Center (455 San Antonio Avenue), and the San Antonio Shopping Center. Auto repairs have been performed onsite since at least the 1970s, and evidence of materials and wastes' handling containers were noted during our reconnaissance. However, the location is cross gradient to the Property. This site was not listed on any databases that track releases, remedial investigations or removal actions, and is not anticipated to present an REC to the Property at this time.

3.0 RECORDS REVIEW

3.1 Standard Environmental Record Sources

3.1.1 State and Federal Regulatory Review

Information from standard Federal and state environmental record sources was provided through Environmental Data Resources (EDR). Data from governmental agency lists are updated and integrated into one database, which is updated as these data are released. This integrated database also contains postal service data in order to enhance address matching. Records from one government source are compared to records from another to clarify any address ambiguities. The demographic and geographic information available provides assistance in identifying and managing risk. The accuracy of the geocoded locations is approximately +/-300 feet.

In some cases, location information supplied by the regulatory agencies is insufficient to allow the database companies to geocode facility locations. These facilities are listed under the unmappables section within the EDR report. A review of the unmappable facilities indicated that none of these facilities are within the ASTM minimum search distance from the Property.

Regulatory information from the following database sources regarding possible recognized environmental conditions, within the ASTM minimum search distance from the Property, was reviewed. Specific facilities are discussed below if determined likely that a potential recognized environmental condition has resulted at the Property from the listed facilities. Please refer to Appendix C-1 for a complete listing.

Federal NPL

The National Priorities List (NPL) is the Environmental Protection Agency (EPA) database of uncontrolled or abandoned hazardous waste sites identified for priority remedial actions under the Superfund Program.

The Property is not listed as a NPL facility. No NPL sites are located within one mile of the Property.

Federal CERCLIS List

The Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) list is a compilation of sites that the EPA has investigated or is currently investigating for a release or threatened release of hazardous substances.

The Property is not listed as a CERCLIS facility. No CERCLIS sites are listed within one-half mile of the Property.

Federal CERCLIS NFRAP Sites List

The CERCLIS No Further Remedial Action Planned (NFRAP) List is a compilation of sites that the EPA has investigated, and has determined that the facility does not pose a threat to human health or the environment, under the CERCLA framework. .

The Property is not listed as a CERCLIS-NFRAP facility. No CERCLIS-NFRAP sites are listed on or adjoining the Property.

Federal Resource Conservation and Recovery Act (RCRA) CORRACTS

TSD Facilities List

The EPA Resource Conservation and Recovery Act (RCRA) Program identifies and tracks hazardous waste from the point of generation to the point of disposal. The RCRA Treatment, Storage and Disposal (TSD) database is a compilation by the EPA of reporting facilities that treat, store or dispose of hazardous waste. The CORRACTS database is the EPA's list of treatment storage or disposal facilities subject to corrective action under RCRA.

The Property is not listed as a RCRA CORRACTS TSD facility. No RCRA CORRACTS TSD facilities are listed within one mile of the Property.

Federal Resource Conservation and Recovery Act (RCRA) Non-CORRACTS TSD Facilities List

The RCRA TSD database is a compilation by the EPA of reporting facilities that treat, store or dispose of hazardous waste.

The Property is not listed as a RCRA-TSD facility. No RCRA TSD sites are listed within one-half mile of the Property.

Federal RCRA Generator List

The RCRA program identifies and tracks hazardous waste from the point of generation to the point of disposal. The RCRA Generators database is a compilation by the EPA of reporting facilities that generate hazardous waste.

The Property is not listed as a RCRA facility. No RCRA Generator facilities are listed on the Property or on the adjacent properties, other than the Sears facility to the west. This auto repair facility is identified as a small-quantity generator. No violations are listed in the database report, and this listing does not present an REC to the Property.

Federal Emergency Response Notification System (ERNS)

The Emergency Response Notification System (ERNS) is a national database used to collect information on reported release of oil or hazardous substances.

No ERNS sites were listed on the Property or on the adjacent properties.

State Priority List

The CalEPA maintains a State Priority List (SPL) of sites considered to be actually or potentially contaminated and presenting a possible threat to human health and the environment.

The Property is not listed as a SPL facility. No SPL sites are listed within one mile of the Property.

State CERCLIS-Equivalent List

The CalEPA maintains a State CERCLIS-equivalent list (SCL) of sites under investigation that could be actually or potentially contaminated and presenting a possible threat to human health and the environment.

The Property is not listed as a State CERCLIS facility. No SCL sites are listed within one-half mile of the Property.

Solid Waste/Landfill Facilities (SWLF)

A database of SWLF is prepared by the Division of Solid Waste Management.

The Property is not listed as a SWLF facility. No SWLF facilities are listed within one-half mile of the Property.

State Leaking Underground Storage Tank List (LUST)

The Regional Water Quality Control Board compiles lists of all leaks of hazardous substances from underground storage tanks.

The Property is not listed as a LUST facility. Sixteen LUST facilities were identified within one-half mile of the Property. Of these sixteen, thirteen are identified as "soil only" cases or cases that have been granted a "case closed" status. The remaining sites are:

- **Texaco, 334 San Antonio, approximately 317 feet north northeast of the subject Property**, was identified as a LUST case. According to the database report, the site is undergoing remediation. Due to its status, distance and down to cross gradient location, this site should not pose a concern to the subject Property.
- **Old Mill Tierra, 255 San Antonio, approximately 1,078 feet north northeast of the subject Property**, was identified as a LUST case. According to the database report, the site is undergoing characterization. Due to its status, distance and down to cross gradient location, this site should not pose a concern to the subject Property.
- **Unocal, 895 San Antonio, approximately 2,465 feet south southwest of the subject Property**, was identified as a LUST case. According to the database report, the site is undergoing characterization. Due to its status and distance, this site should not pose a concern to the subject Property.

State Underground Storage Tank List (UST)

The Regional Water Quality Control Board compiles a list of UST locations.

The Property is not listed as an UST facility. No registered UST facilities are listed adjacent to the Property.

3.1.2 Local Regulatory Review

3.1.2.1 County Recorder/ Assessor

According the Santa Clara County Recorder's Office, no environmentally-related liens or deed restrictions have been recorded against the Property.

3.1.2.2 Fire Officials

Records from the City of Mountain View Fire Department were reviewed for evidence indicating the presence of underground storage tanks and for the use of hazardous materials. According to the Department no record was found for the property address.

3.1.2.3 Building Department

Records from City of Mountain View Building Department were reviewed for evidence indicating the developmental history of the Property, and for the presence of documentation relative to underground storage tanks. The records indicate the current Property structure was constructed in 1960. Prior land use was indicated as vacant. Permits were reviewed from 1960, 1965, 1966, 1973, 1978, 1989, 1990, 1996 and 1997. No permits of concern were found in the review. In particular, none of the permits indicated that dry cleaning was performed onsite.

3.1.2.4 Other Agencies

A file review was conducted at the City of Mountain View Planning. No records indicated current or past usage of hazardous materials, USTs or ASTs at the Property.

3.2 Physical Setting Sources

3.2.1 Topography

The United States Geological Survey (USGS), Milpitas Quadrangle 7.5 minute series topographic map was reviewed for this ESA. This map was published by the USGS in 1991. According to the contour lines on the topographic map, the Property is located approximately 75 feet above mean sea level (MSL). The contour lines in the area of the Property indicate the area is sloping downward gently to the northeast. San Francisco Bay is located approximately five miles northeast of the Property.

The Property is depicted on the 1991 map as developed with three large structures. No surface waters are depicted as present on or adjacent to the Property, nor are production wells or other significant surface features depicted on the USGS map.

3.2.2 Soils/Geology

The Property is located in the Santa Clara Valley groundwater basin. The Santa Clara subbasin occupies a structural trough parallel to the northwest trending Coast Ranges. The Diablo Range bounds it on the west and the Santa Cruz Mountains form the basin boundary on the east. It extends from the northern border of Santa Clara County to the groundwater divide near the town of Morgan Hill. The dominant geohydrologic feature is a large inland valley (Fio and Leighton 1995). The valley is drained to the north by tributaries to San Francisco Bay including Coyote Creek, the Guadalupe River, and Los Gatos Creek. Annual precipitation for the Santa Clara basin ranges from less than 16 inches in the valley to more than 28 inches in the upland areas.

Santa Clara Formation- The Santa Clara Formation is of Plio-Pleistocene age and rests unconformably on impermeable rocks that mark the bottom of the groundwater subbasin (DWR 1975). The Santa Clara Formation is exposed only on the west and east sides of the Santa Clara Valley. Where exposed, it is composed of poorly sorted deposits ranging in grain size from boulders to silt (DWR 1975). Well logs indicate that permeability increases from west to east and that in the central part of the valley permeability and grain size decrease with depth (DWR 1975).

Pleistocene-Holocene Alluvium. The Pleistocene to Holocene alluvium is the most important water bearing unit in the Santa Clara subbasin. The permeability of the valley alluvium is generally high and principally all large production wells derive their water from it (DWR 1975). Comprised generally of unconsolidated gravel, sand, silt, and clay it is deposited principally as series of convergent alluvial fans. It becomes progressively finer-grained at the central portions of the valley. A confined zone is created in the northern portion of the subbasin where overlain by a clay layer of low permeability (SCVWD 2001). The southern portion of the subbasin is generally unconfined and contains no thick clay layers (SCVWD 2001). Near-surface groundwater is expected to be present at depths of approximately 30 feet below ground surface and moving toward San Francisco Bay to the northeast.

3.2.3 Hydrology

The water bearing formations of the Santa Clara subbasin include Pliocene to Holocene age continental deposits of unconsolidated to semi-consolidated gravel, sand, silt and clay. Two members form this group, the Santa Clara Formation of Plio-Pleistocene age and the younger alluvium of Pleistocene to Holocene age (DWR 1975). Lithologic similarities make distinction between these two units difficult based on available well data. The combined thickness of these two units probably exceeds 1500 feet (DWR 1967) and represents the practical bedrock level in this area.

The Property does not overlie a sole source aquifer.

3.2.4 Flood Zone Information

A review of the FEMA/ESRI website, published by the Federal Emergency Management Agency, was performed. According data found on the website, the Property is not located in a 100-year or 500-year flood plain.

The nearest surface water in the vicinity of the Property is the Palo Alto Creek located approximately 0.5 mile north of the Property. No settling ponds, lagoons, surface impoundments, wetlands or natural catchbasins were observed at the Property during this investigation.

3.2.5 Oil and Gas Exploration

According to California DOG maps, there is no oil well or natural gas production in the vicinity of the subject Property.

3.3 Historical Use Information

The Property was originally developed prior to 1939 for agricultural and residential purposes. In 1960, the Property was originally developed with commercial retail stores. The Property was extensively remodeled in the 1970s and in 1997.

The current Property buildings have not been utilized for environmentally sensitive purposes, such as photo developing or dry cleaning; rather, the tenants currently present at the Property, or similar type tenants, have occupied them.

3.3.1 Aerial Photographs

Available aerial photographs dated 1939, 1965, 1974, 1980, and 2003 from the USGS in Menlo Park, California, were reviewed for this ESA. Copies of selected photographs are included in Appendix B-1 of this report. The photographs are discussed below:

Date: 1939

Scale: NA

Photo ID: NA

Description: The Property is depicted with a single family residence and agricultural production on-site. The surrounding areas are similarly developed with small agricultural farms. No recognized environmental conditions are visible in the photograph.

Date: 1965

Scale: NA

Photo ID: NA

Description: The Property is depicted with commercial buildings and a parking lot. The surrounding area is shown with residential and commercial development surrounding the Property. No recognized environmental conditions are visible in the photograph.

Date: 1974

Scale: NA

Photo ID: NA

Description: Property and surround sites are generally unchanged from 1965. No recognized environmental conditions are visible in the photograph.

Date: 1980

Scale: NA

Photo ID: NA

Description: Property and surround sites are generally unchanged from 1965. No recognized environmental conditions are visible in the photograph.

Date: 2003

Scale: NA

Photo ID: NA

Description: The Property is depicted with commercial buildings and a parking lot in its current retail configuration. The surrounding area is shown with residential and commercial development surrounding the Property.

3.3.2 Fire Insurance Maps

No historical Sanborn Fire Insurance maps for the Property from Environmental Data Resources (EDR) were available for the subject Property. A copy of the No Coverage letter is appended.

3.3.3 City Directories

Historical City directories, published by Haines, were reviewed at the Mountain View Public Library for past names and businesses that were listed for the Property and adjoining properties. The findings are presented in the following table:

YEAR	ON-SITE	ADJOINING PROPERTIES
1962	Thrifty Drug, Mary's Bakery, One Hour Cleaners, Crocker Bank	North – Franciscan Glass, Moore's Dairy Products South – Purity Stores East – No Listing West - Sears
1968	Thrifty Drug, San Antonio Hobby, One Hour Cleaners, Crocker Bank	North –Roberts Furniture, Brentwood Farms Dairy Products South – Dunkers Delite Donut East – Continentals Markets West - Sears
1979	Thrifty Drug, Wrap Off Salon, Porfido Dry Cleaners, Foothill Bank	North – Milk Pail Markets, Mike's Shell Service, Barron Plumbers, Pacific Stereo South – No Listing East – No Listing West - Sears
1984	Thrifty Drug, Wrap Off Salon, Porfido Dry Cleaners, Foothill Bank	North – Milk Pail Markets, Mike's Shell Service, Barron Plumbers, Pacific Stereo South – No Listing East – Home Yardage West – Sears Financial
1990-1991	Ross, Foothill Bank	North – Milk Pail Markets, Panda Chinese, Toss it Fresh, Barron Plumbers, Sound Fix, Sound Goods South – N Y Fabrics East – Safeway West - Sears
1994	Ross, Red Wing Shoes, Foothill Bank	North – Milk Pail Markets, Panda Chinese, Toss it Fresh, Barron Plumbers, Sound Fix, Sound Goods South – N Y Fabrics East – Safeway West - Sears
1999-2000	Ross, Fantastic Hair & Nails , Kumon Math Center, Beverages and More	North – Milk Pail Markets, Sabor Mexico, Wok Express, Barron Plumbers, Biocybernaut Soma Ergonomics, Sound Goods South – JoAnn Fabrics East – Safeway

YEAR	ON-SITE	ADJOINING PROPERTIES
		West - Sears
2004	Ross, Fantastic Hair & Nails , Kumon Math Center, Beverages and More	North – Milk Pail Markets, Sabor Mexico, Barron Plumbers, Biocybernaut Soma Ergonomics, Sound Goods South – No Listing East – Safeway West – Sears

To Note: While dry cleaning tenants were noted within the center for the years 1962, 1968, 1979, and 1984, it is important that no other information was identified to support these listings. Specifically, LAC reviewed a prior NAC Phase I ESA report for the Property dated 1997 which did not identify any dry cleaning operations onsite dating back to the 1950s in the research of permits, records, or other agency sources. Further, our review of Building Department Permits and Fire Department Permits for this current assessment, covering the period 1960 through the present noted the new construction record for the existing structures, and significant renovation permits in the 1970s, 1980s, and 1990s and periodic inspection records. However, neither the Building Department Records or Fire Department Records reviewed for this assessment noted the presence of dry cleaners onsite, or any other similar operation that would use related chemicals. In addition, LAC's August 2005 assessment performed on the larger, main portion of the San Antonio Center (30+ acres retail parcel located adjacent east and southeast of the Property) include a historical review of adjacent sites and did not identify dry cleaners listings at the Property. Finally, our review of available County, State and Federal Databases did not identify the Property on any listings suggestive of a dry cleaning operation and/or storing or generating hazardous wastes. Given the above information, LAC notes that the listing for an onsite dry cleaner tenant could be characterized as environmentally significant. The only way to absolutely determine whether the Property has been adversely impacted by these listings would be to perform a subsurface investigation. However, based on the information available at this time, LAC does not recommend further investigation of the Property at this time.

3.3.4 Chain of Title

A 50-year chain-of-title was not requested for this study. Historical use of the Property was researched using other standard historical sources.

3.3.5 Additional Environmental Record Sources

LAC reviewed one previous Phase I Assessment reports for this report. This report is the Phase I Environmental Site Assessment for 405-4233 San Antonio Road, prepared by National Assessment Corporation (NAC) in August 1997. No significant findings were reported in the NAC report and no environmental concerns were identified. In particular, their review of historical documentation dating back to the 1950s (prior to construction of the existing improvements) did not identify any evidence that dry cleaning had been performed onsite, contradicting the city directory listings above. Further investigation was not recommended.

3.3.6 Historical Use Information on Adjoining Properties

By review of the standard historical sources referenced above, the historical uses of the adjoining properties are summarized below:

- North:** Prior to the current use as a commercial building, the property to the north was agricultural/residential. This general area was used for agricultural purposes back to at least 1939. Prior to this time, the land was undeveloped.
- South:** Prior to the current use as a commercial building, the property to the south was agricultural/residential. This general area was used for agricultural purposes back to at least 1939. Prior to this time, the land was undeveloped.
- East:** Prior to the current use as a commercial building, the property to the east was agricultural/residential. This general area was used for agricultural purposes back to at least 1939. Prior to this time, the land was undeveloped.
- West:** Prior to the current use as a commercial building, the property to the west was agricultural/residential. This general area was used for agricultural purposes back to at least 1939. Prior to this time, the land was undeveloped.

4.0 SITE RECONNAISSANCE

The Property was inspected by John Geare on November 28, 2005. The weather at the time of the site visit was cloudy.

4.1 General Site Characteristics

4.1.1 Solid Waste Disposal

Solid waste on the Property is collected in two 10-cubic yard dumpsters situated in a fenced enclosure at the northeast corner of the Property. The solid waste is collected once a week by Waste Management, and is deposited at the Santa Clara County Landfill. The dumpsters were noted to contain miscellaneous cardboard at the time of the Property reconnaissance and no indication of potentially hazardous material disposal was noted during LAC's reconnaissance.

4.1.2 Surface Water Drainage

Storm drains are located in various locations throughout the parking lots, along curbs and in landscaped areas, which discharge to the municipal stormwater management system.

4.1.3 Wells and Cisterns

No aboveground evidence of wells or cisterns was observed during the site reconnaissance.

4.1.4 Wastewater

No indications of industrial wastewater disposal or treatment facilities were observed during the on-site reconnaissance.

4.1.5 Additional Site Observations

No additional relevant general site characteristics were observed. In particular, no evidence of visible suspect mold, water intrusion or other moisture concerns were noted during the onsite reconnaissance.

4.2 Potential Environmental Conditions

4.2.1 Hazardous Materials and Petroleum Products Used or Stored at the Site

With the exception of routine maintenance and janitorial supplies that appear to be properly stored, no evidence of the use of hazardous materials or wastes was observed on the Property.

4.2.1.1 Unlabeled Containers and Drums

No unlabeled containers or drums were observed during the site reconnaissance.

4.2.1.2 Disposal Locations of Regulated/ Hazardous Waste

No obvious indications of hazardous waste generation, storage or disposal were observed on the Property or were indicated during interviews.

4.2.2 Evidence of Releases

No obvious indications of hazardous material or petroleum product releases, such as stained areas or stressed vegetation, was observed during the site reconnaissance or

reported during interviews. Asphalt-paved parking areas exhibited normal surface staining due to use.

4.2.3 Polychlorinated Biphenyls (PCBs)

Older transformers and other electrical equipment could contain polychlorinated biphenyls (PCBs) at a level that subjects them to regulation by the U.S. EPA. PCBs in electrical equipment are controlled by United States Environmental Protection Agency regulations 40 CFR, Part 761. Under the regulations, there are three categories into which electrical equipment can be classified:

- Less than 50 parts per million (PPM) of PCBs – “Non-PCB” transformer
- 50 ppm-500 ppm – “PCB-Contaminated” electrical equipment
- Greater than 500 ppm – “PCB” transformer

LAC observed one pad-mounted electrical transformer on the Property. The unit is situated outside the northeast corner of the building. The unit was not labeled as to its PCB status; however, it is labeled to be owned and operated by Pacific Gas & Electric (PG&E). No indication of staining, leaks or fire damage was observed on or around the bases of the unit.

No other electrical equipment expected to contain PCBs was observed on the Property during LAC’s reconnaissance.

4.2.4 Landfills

No evidence of on-site landfilling was observed or reported during the site reconnaissance.

4.2.5 Pits, Ponds, Lagoons, Sumps, and Catch Basins

No evidence of on-site pits, ponds or lagoons was observed or reported during the site reconnaissance. No evidence of sumps or catch basins, other than used for stormwater removal, was observed or reported during the site reconnaissance.

4.2.6 On-Site ASTs and USTs

No evidence of aboveground or underground storage tanks was observed during the site reconnaissance or reported during interviews.

4.2.7 Radiological Hazards

No radiological substances or equipment was observed or reported stored on the Property.

4.2.8 Drinking Water

The Property is connected to the city water supply provided by the City of Mountain View. According to city staff, the drinking water supplied to the site is within state and federal standards, including lead and copper.

4.2.9 Additional Hazard Observations

No additional hazards were observed on the Property.

4.2.10 Asbestos-Containing Materials (ACM)

In accordance with the Scope of Services, LAC has conducted a limited, visual evaluation of interior, accessible areas for the presence of suspect asbestos containing materials (ACM) at the Property. The objective of this visual survey was to note the presence and condition of suspect ACM observed.

Based on the date of construction (1960) there is a potential that ACM was used in construction materials. However, the building was last remodeled in 1997. Review of permits indicates that the renovation was substantial, and extended outward to the shell, likely removing the majority of potential asbestos containing materials.

Regardless, LAC walked the Property and inspect for potential ACM. The survey consisted of noting observable materials (materials which were readily accessible and visible during the course of the site reconnaissance) that are commonly known to potentially contain asbestos. This activity was not designed to discover all sources of suspect ACM, PACM, or asbestos at the site; or to comply with any regulations and/or laws relative to planned disturbance of building materials such as renovation or demolition, or any other regulatory purpose. Rather, it is intended to give the lender an indication if significant (significant due to quantity, accessibility, or condition) potential sources of ACM or PACM are present at the Site. Additional sampling, inspection, and evaluation will be warranted for any other use.

Given the extent of the recent (1997) renovations, no suspect friable or damaged non-friable materials were identified. Therefore, no sampling was performed as part of this assessment. Prior to any disturbance of the construction materials within this facility, a comprehensive ACM survey is recommended.

4.2.11 Radon

The US EPA has prepared a map to assist National, State, and local organizations to target their resources and to implement radon-resistant building codes. The map divides the country into three Radon Zones, Zone 1 being those areas with the average predicted indoor radon concentration in residential dwellings exceeding the EPA Action limit of 4.0 picoCuries per Liter (pCi/L). It is important to note that the EPA has found homes with elevated levels of radon in all three zones, and the EPA recommends site specific testing in order to determine radon levels at a specific location. However, the map does give a valuable indication of the propensity of radon gas accumulation in structures. Review of the EPA Map of Radon Zones places the Property in Zone 2, where average predicted radon levels are between 2.0 and 4.0 pCi/L.

4.2.12 Lead Based Paint

Due to the age of the structure (constructed in 1960, complete remodel in 1997), and non-residential usage, a lead-based paint screening was not conducted in conjunction with this assessment.

4.2.13 Mold

As part of this assessment, LAC performed a limited visual inspection for the significant presence of mold. A class of fungi, molds have been found to cause a variety of health problems in humans, including allergic, toxicological and infectious responses. Molds are decomposers of organic materials, thrive in humid environments and produce tiny spores to reproduce, just as plants produce seeds. When mold spores land on a damp spot indoors, they may begin growing and digesting whatever they are growing on in order to survive.

When excessive moisture or water accumulates indoors, mold growth will often occur, particularly if the moisture problem remains undiscovered or unaddressed. As such, interior areas of buildings characterized by poor ventilation and high humidity are the most common locations of mold growth. Building materials including drywall, wallpaper, baseboards, wood framing, insulation and carpeting often play host to such growth.

LAC observed interior areas of the Property structure for the significant presence of mold. LAC did not note obvious visual or olfactory indications of the presence of mold, nor did LAC observe obvious indications of significant water damage. As such, no bulk sampling of suspect surfaces was conducted as part of this assessment.

This activity was not designed to discover all areas, which may be affected by mold growth on the Property. Rather, it is intended to give the client an indication if significant (based on observed areas) mold growth is present at the Property. Additional areas of mold not observed as part of this limited assessment, possibly in pipe chases, HVAC systems and behind enclosed walls and ceilings, may be present on the Property.

5.0 INTERVIEWS

Interviews were conducted with the following individuals. Findings from these interviews are discussed in the appropriate sections in this report.

Site

6.0 FINDINGS AND CONCLUSIONS

6.1 Findings

6.1.1 On-Site Environmental Conditions

No on-site environmental conditions were identified during the course of this assessment.

6.1.2 Off-Site Environmental Conditions

No off-site environmental conditions were identified that were considered likely to impact the Property.

6.1.3 Previously Resolved Environmental Conditions

No previously resolved issues were revealed by this assessment. No historical recognized environmental conditions were identified in connection with the Property during the course of this assessment.

6.1.4 *De Minimis* Environmental Conditions

No *de minimis* environmental conditions were identified in connection with the Property during the course of this assessment.

6.2 Opinion

It is LAC's professional opinion that the Property has a clear, documented history that revealed no environmental conditions or concerns.

6.3 Conclusions

LAC has performed a Phase I ESA in conformance with the scope and limitations of ASTM Practice E 1527-00 of 405-423 San Antonio Road, Mountain View, California 94041, the Property. Any exceptions to or deletions from this practice are described in Section 1.4 of this report. This assessment has revealed no evidence of recognized environmental conditions in connection with the Property.

6.4 Recommendations

Based on the conclusions of this assessment, LAC does not recommend further investigation of the Property at this time.

6.5 Deviations

This Phase I ESA substantially complies with the scope of services and ASTM 1527-00, as amended, except for exceptions and/or limiting conditions as discussed in Section 1.4.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc. (EDR). The report meets the minimum government records search requirements of EPA's Standards and Practices for All Appropriate Inquiries, 40 CFR Part 312 (AAI) and the ASTM Standard Practice for Environmental Site Assessments, E 1527-05. Search distances are per AAI and ASTM standards or custom distances requested by the user.

USGS TOPOGRAPHIC MAP ASSOCIATED WITH TARGET PROPERTY

Target Property: 37122-D1 MOUNTAIN VIEW, CA
Source: USGS 7.5 min quad index

TARGET PROPERTY SEARCH RESULTS

The target property was not listed in any of the databases searched by EDR.

DATABASES WITH NO MAPPED SITES

No mapped sites were found in EDR's search of available "reasonably ascertainable ") government records either on the target property or within the search radius around the target property for the following databases:

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified.

EXECUTIVE SUMMARY

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property. Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

FEDERAL RECORDS

RCRAInfo: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRAInfo replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System(RCRIS). The database includes selective information on sites which generate, transport, store , treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month. Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month Large quantity generators generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month. Transporters are individuals or entities that move hazardous waste from the generator offsite to a facil

A review of the RCRA-SQG list, as provided by EDR, and dated 08/11/2005 has revealed that there are 7 RCRA-SQG sites within approximately 0.25 miles of the target property.

BEP: Department of Health Services developed a site-specific expenditure plan as the basis for an appropriation of Hazardous Substance Cleanup Bond Act funds. It is not updated.

A review of the CA BOND EXP. PLAN list, as provided by EDR, has revealed that there is 1 CA BOND EXP. PLAN site within approximately 1 mile of the target property.

<u>Lower Elevation</u>	<u>Address</u>	<u>Dist / Dir</u>	<u>Map ID</u>	<u>Page</u>
PLESSEY MICRO SCIENCES	2274 MORA DRIVE	1/2 - 1 ESE	O64	98

CORTESE: This database identifies public drinking water wells with detectable levels of contamination, hazardous substance sites selected for remedial action, sites with known toxic material identified through the abandoned site assessment program, sites with USTs having a reportable release and all solid waste disposal facilities from which there is known migration. The source is the California Environmental Protection Agency/Office of Emergency Information.

A review of the Cortese list, as provided by EDR, has revealed that there are 30 Cortese sites within approximately 1 mile of the target property.

HAZNET: The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000-1,000,000 annually, representing approximately 350,000-500,000 shipments. Data from non-California manifests & continuation sheets are not included at the present time. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, & disposal method. The source is the Department of Toxic Substance Control is the agency

A review of the HAZNET list, as provided by EDR, and dated 12/31/2003 has revealed that there are 30 HAZNET sites within approximately 0.25 miles of the target property.
