 Agency Contact: Cliff Petriella Agency Phone: (440) 460-3727
 Design Flow: 0.18000 Million Gal/Day Baseline Flow: 0.18000 Million Gal/Day
 Facility Type: Industrial - Facility that treats and/or disposes of liquid or semisolid wastes from any servicing, producing, manufacturing or processing operation of whatever nature, including mining, gravel washing, geothermal operations, air conditioning, ship building and repairing, oil production, storage and disposal operations, water pumping.
 Facility Status: Active - Any facility with a continuous or seasonal discharge that is under Waste Discharge Requirements.
 Agency Type: Private
 Waste Type: Contaminated Ground Water - Hazardous/Influent or Solid Wastes that contain toxic, corrosive, ignitable or reactive substances and must be managed according to applicable DOHS standards.
 Threat to Water: Moderate Threat to Water Quality. A violation could have a major adverse impact on receiving biota, can cause aesthetic impairment to a significant human population, or render unusable a potential domestic or municipal water supply. Awsthetic impairment would include nuisance from a waste treatment facility.
 Complexity: Category B - Any facility having a physical, chemical, or biological waste treatment system (except for septic systems with subsurface disposal), or any Class II or III disposal site, or facilities without treatment systems that are complex, such as marinas with petroleum products, solid wastes, and sewage pump out facilities.
 Reclamation: No reclamation requirements associated with this facility.
 POTW: The facility is not a POTW.
 NPDES Number: CAG912003 The 1st 2 characters designate the state. The remaining 7 are assigned by the Regional Board

Actual:
 54 ft.

BEP:
 Site Description : From about the mid-1960s to 1981, Plessey manufactured electronic components. Chemical processes used included plating and etching. Wastewater was drained to underground storage tanks where material or waste was neutralized and stored prior to disposal.
 Hazardous Waste Desc : Wastes include perchloroethylene (PCE), trichloroethylene (TCE), chromic acid and xylene.
 Threat To Public Health & Env : Depth of the shallowest aquifer is about 32 feet. Ground water contamination and its potential impact on drinking water supplies is the primary concern.
 Site Activity Status : Plessey Micro Sciences, Inc., retained a contractor and completed a preliminary investigation in June, 1987. Result of the investigation indicated ground water contamination by perchloroethylene, trichloroethylene and methylene chloride. A Phase II RI report was submitted September, 1988. It appears that further investigation will be required before the FS and RAP can be Started.
 Project Revenue Source Co. : Plessey, Inc.
 PRS Company Address : 325 Westchester Avenue
 White Plains, NY 10604
 Project Revenue Source Desc : DHS has issued a remedial action order and Plessey has stipulated to comply with this order. DHS has budgeted \$50,000 for oversight and monitoring of cleanup efforts. DHS will recover 100 percent of direct costs plus staff costs and overhead related to the project. The responsible parties will pay all costs associated with remedial investigations and cleanup activities.
 Responsible Party : RESPONSIBLE PARTY-LEAD SITE CLEANUP WORKPLAN

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that this EDR report meets or exceeds the 90-day updating requirement of the ASTM standard.

FEDERAL RECORDS

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 07/01/05	Source: EPA

	Data Release Frequency: Quarterly

DELISTED NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

	Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner receives notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Data Release Frequency: Quarterly

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

As of February 1995, CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration. EPA has removed approximately 25,000 NFRAP sites to lift the unintended barriers to the redevelopment of these properties and has archived them as historical records so EPA does not needlessly repeat the investigations in the future. This policy change is part of the EPA's Brownfields Redevelopment Program to help cities, states, private investors and affected citizens to promote economic redevelopment of unproductive urban sites.

RCRA: Resource Conservation and Recovery Act Information

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRAInfo replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System (RCRIS). The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month. Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month. Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month. Transporters are individuals or entities that move hazardous waste from the generator off-site to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

US ENG CONTROLS: Engineering Controls Sites List

A listing of sites with engineering controls in place. Engineering controls include various forms of caps, building foundations, liners, and treatment methods to create pathway elimination for regulated substances to enter environmental media or effect human health.

Date of Government Version: 08/02/05	Source: Environmental Protection Agency
Date Data Arrived at EDR: 08/12/05	Telephone: 703-603-8867
Date Made Active in Reports: 10/06/05	Last EDR Contact: 10/03/05
Number of Days to Update: 55	Next Scheduled EDR Contact: 01/02/06
	Data Release Frequency: Varies

US INST CONTROL: Sites with Institutional Controls

A listing of sites with institutional controls in place. Institutional controls include administrative measures, such as groundwater use restrictions, construction restrictions, property use restrictions, and post remediation care requirements intended to prevent exposure to contaminants remaining on site. Deed restrictions are generally required as part of the institutional controls.

Number of Days to Update: 9	Next Scheduled EDR Contact: 11/07/05
	Data Release Frequency: Semi-Annually

FUDS: Formerly Used Defense Sites

The listing includes locations of Formerly Used Defense Sites properties where the US Army Corps of Engineers is actively working or will take necessary cleanup actions.

Date of Government Version: 12/31/04	Source: U.S. Army Corps of Engineers
Date Data Arrived at EDR: 06/29/05	Telephone: 202-528-4285
Date Made Active in Reports: 08/08/05	Last EDR Contact: 06/29/05
Number of Days to Update: 40	Next Scheduled EDR Contact: 10/03/05
	Data Release Frequency: Varies

US BROWNFIELDS: A Listing of Brownfields Sites

Included in the listing are brownfields properties addresses by Cooperative Agreement Recipients and brownfields properties addressed by Targeted Brownfields Assessments. Targeted Brownfields Assessments-EPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities--especially those without EPA Brownfields Assessment Demonstration Pilots--minimize the uncertainties of contamination often associated with brownfields. Under the TBA program, EPA provides funding and/or technical assistance for environmental assessments at brownfields sites throughout the country. Targeted Brownfields Assessments supplement and work with other efforts under EPA's Brownfields Initiative to promote cleanup and redevelopment of brownfields. Cooperative Agreement Recipients-States, political subdivisions, territories, and Indian tribes become Brownfields Cleanup Revolving Loan Fund (BCRLF) cooperative agreement recipients when they enter into BCRLF cooperative agreements with the U.S. EPA. EPA selects BCRLF cooperative agreement recipients based on a proposal and application process. BCRLF cooperative agreement recipients must use EPA funds provided through BCRLF cooperative agreement for specified brownfields-related cleanup activities.

Date of Government Version: 08/18/05	Source: Environmental Protection Agency

Number of Days to Update: 49	Next Scheduled EDR Contact: 12/12/05
	Data Release Frequency: Semi-Annually

CONSENT: Superfund (CERCLA) Consent Decrees

Major legal settlements that establish responsibility and standards for cleanup at NPL (Superfund) sites. Released periodically by United States District Courts after settlement by parties to litigation matters.

Date of Government Version: 12/14/04	Source: Department of Justice, Consent Decree Library
Date Data Arrived at EDR: 02/15/05	Telephone: Varies
Date Made Active in Reports: 04/25/05	Last EDR Contact: 07/25/05
Number of Days to Update: 69	Next Scheduled EDR Contact: 10/24/05
	Data Release Frequency: Varies

ROD: Records Of Decision

Record of Decision. ROD documents mandate a permanent remedy at an NPL (Superfund) site containing technical and health information to aid in the cleanup.

Date of Government Version: 06/08/05	Source: EPA
Date Data Arrived at EDR: 07/11/05	Telephone: 703-416-0223
Date Made Active in Reports: 08/08/05	Last EDR Contact: 07/06/05
Number of Days to Update: 28	Next Scheduled EDR Contact: 10/03/05
	Data Release Frequency: Annually

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized. In 1978, 24 inactive uranium mill tailings sites in Oregon, Idaho, Wyoming, Utah, Colorado, New Mexico, Texas, North Dakota, South Dakota, Pennsylvania, and on Navajo and Hopi tribal lands, were targeted for cleanup by the Department of Energy.

Date of Government Version: 12/29/04	Source: Department of Energy
Date Data Arrived at EDR: 01/07/05	Telephone: 505-845-0011

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

Data Release Frequency: Quarterly

NFE: Properties Needing Further Evaluation

This category contains properties that are suspected of being contaminated. These are unconfirmed contaminated properties that need to be assessed using the PEA process. PEA in Progress indicates properties where DTSC is currently conducting a PEA. PEA Required indicates properties where DTSC has determined a PEA is required, but not currently underway.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

Electric Power Transmission Line Data

Source: PennWell Corporation

Telephone: (800) 823-6277

This map includes information copyrighted by PennWell Corporation. This information is provided on a best effort basis and PennWell Corporation does not guarantee its accuracy nor warrant its fitness for any particular purpose. Such information has been reprinted with the permission of PennWell.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

Source: American Hospital Association, Inc.

Telephone: 312-280-5991

The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing

Source: Centers for Medicare & Medicaid Services

Telephone: 410-786-3000

A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes

Source: National Institutes of Health

Telephone: 301-594-6248

Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools

Source: National Center for Education Statistics

Telephone: 202-502-7300

The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools

Source: National Center for Education Statistics

Telephone: 202-502-7300

The National Center for Education Statistics' primary database on private school locations in the United States.

Daycare Centers: Licensed Facilities

Source: Department of Social Services

Telephone: 916-657-4041

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 from the U.S. Fish and Wildlife Service.

QUALIFICATIONS OF ENVIRONMENTAL PROFESSIONALS

JOHN C. GEARE
Professional Associate

Education: B.A. in Environmental Studies and Planning, California
State University, Sonoma
Graduate Studies in Ecology, University of California, Davis

Registration(s): USEPA Certified Asbestos Consultant
HAZWOPER 40 Hour Certified
California EPA Registered Environmental Assessor

Years of Experience: 14

Summary of Professional Experience

Mr. Geare has more than 14 years experience in performing Environmental Site Assessments.

Mr. Geare has completed over 750 Phase I Assessments for a wide range of property types including electrical utility facilities, agricultural chemical distribution facilities, hotels, commercial, retail and industrial properties. In addition, he conducted a county-wide environmental health and safety analysis for the Department of Health Services in Santa Cruz County.

Prior to joining LAC, Mr. Geare provided technical, logistic and planning support for a disc drive manufacturer. His duties included material and engineering support for three offshore locations in the Philippines, Singapore and Thailand. He was the lead engineering liaison for two factory transfers from Scotts Valley to Asia. He performed engineering and manufacturing planning and shipping support for overseas and domestic production, verified inventory, provided troubleshooting for engineering and production departments.

M. EVANS HOWELL, MS, REA

Vice President

Education: B.S. Earth and Planetary Sciences, Northeast Louisiana University
M.S. Environmental Science, California State University, Fullerton

Registration(s): Registered Environmental Assessor, 06257
Former Cal-OSHA Asbestos Consultant 95-1618
AHERA Certified Asbestos Inspector
Supervisor, Hazardous Materials Handling and Response
Hazardous Materials Handling and Response Certificate

Years of Experience: 12

Summary of Professional Experience

Mr. Howell has 12 years of experience in the environmental assessment field. He has a strong background in providing environmental due diligence for real estate going through securitization, as well as the performance of Phase I - III ESAs, asbestos studies, and lead-based paint surveys.

Previously, Mr. Howell was vice president of a national environmental firm, where he managed environmental site assessments, characterizations, asbestos abatement and monitoring, remediations and underground storage tank removals. Mr. Howell also conducted aquifer analyses and computer modeling of soil and groundwater systems as well as provided asbestos building audits and removal specifications.

Mr. Howell was also principal of his own firm, located in Southern California, where he was responsible for the overall technical and business management of the firm. He also managed projects in environmental site assessment, characterization, asbestos abatement and monitoring, remediation and underground storage tank removal. Mr. Howell also analyzed airborne particulates in clean rooms and investigated worker complaints of respiratory distress.

For a national geoscience company Mr. Howell served as a senior environmental scientist and managed environmental Phase I and II environmental site assessments for residential, commercial, industrial and vacant properties, including large portfolio property site assessments for substantial fiduciary clients. He also performed asbestos-related services, including investigations, abatement and ongoing monitoring.

As a managing partner of another environmental services firm, Mr. Howell handled business management, client interface and technical projects. As an environmental scientist with another firm Mr. Howell conducted surface and subsurface geologic and hydrogeologic investigations, as well as underground storage tank removal and site closures. He also handled disposal and remediation of hazardous materials and managed projects involving toxic and chemically affected soil and groundwater.

As a hydrogeologist for the Bolsa Chica Conservancy in Huntington Beach, California Mr. Howell performed hydrogeological evaluations of numerous sites and conducted surface and subsurface geologic and hydrogeologic investigations.

Project Experience

- *Column Financial/DLJ* - Client Point Contact and Program Manager for nationwide multi-site services. Manage Phase I, II and III Environmental Site Assessments, asbestos surveys, asbestos abatement design, and asbestos abatement monitoring. Perform in house QA/QC on all reports issued to the client. Conducted over 250 environmental studies to support pooled collateral property undergoing securitization.
- *Wells Fargo Bank* - Client Point Contact for ongoing performance of Phase I-II environmental site assessments, asbestos surveys, lead-based paint surveys. Manage all phases of report management and client interaction with Wells Fargo's Real Estate Technical Services Group for more than 1,000 projects over the past 6 years.
- *AmSouth Bank* - National Client Point Contact for ongoing performance of Phase I-II environmental site assessments, asbestos surveys, lead-based paint surveys. Manage all phases of report management and client interaction with AmSouth Bank's Credit Administration Support Services group located in Birmingham, Alabama for the past 3 years.
- *Holliday, Fenoglio & Fowler* - Client Point Contact for southeast environmental site services. Currently manage Phase I Environmental Site Assessments, asbestos surveys, asbestos abatement design, and asbestos abatement monitoring. Perform in house QA/QC on all reports issued to the client.
- *JP Morgan* - Functioned as regional Project Manager, managing multiple site portfolios ranging from 150 to 250 properties. Services included Phase I, II, & III ESAs, asbestos surveys, operations and maintenance plans, on multiple sites statewide. Oversaw program development, QA/QC, and submittal production.

The land referred to in this survey is situated in the County of Santa Clara, City of Mountain View, State of California, and is described as follows:

PARCEL ONE:

Beginning at an iron pipe set at the point of intersection of the Southeasterly line of San Antonio Avenue (50.00 feet in width) with the Southeasterly prolongation of the center line of Miller Avenue; thence South 25° 36' West along said Southeasterly line of San Antonio Avenue 4.15 feet to an iron pipe set at the Northernmost corner of Lot 3, as said lot is shown upon the map hereinafter referred to; thence South 64° 17' 58" East along a Northeasterly line of said Lot 3, for a distance of 200.00 feet to a PK Nail in concrete base of fence post and the true point of beginning of the parcel of land to be described; thence from said true point of beginning of the parcel of land to be described; thence from said true point of beginning South 56° 43' 04" East along a line which is drawn at right angles to the Southeasterly line of Lot 4, as said lot is shown upon the map hereinafter referred to, for a distance of 457.69 feet to a point on said Southeasterly line of Lot 4; thence North 33° 16' 56" East along said last named line 424.09 feet to an iron pipe set at the Easternmost corner of said Lot 4; thence North 64° 17' 58" West along the Northeasterly line of said Lot 4, for a distance of 710.28 feet to an iron pipe set at the Northernmost corner of said Lot 4 on said Southeasterly line of San Antonio Avenue; thence South 25° 36' West along said Southeasterly line of San Antonio Avenue 40.00 feet to an iron pipe set at the Westernmost corner of said Lot 4; thence along the general westerly line of said Lot 4, for the following courses and distances: South 64° 17' 58" East 300.00 feet to an iron pipe, South 25° 36' West 100.00 feet to an iron pipe, North 64° 17' 58" West 100.00 feet to an iron pipe and South 25° 36' West 148.21 feet to the Northwesterly common corner for said Lots 3 and 4; thence South 25° 36' West along a Northwesterly line of said Lot 3, for a distance of 71.79 feet to the true point of beginning, a portion of Lots 3 and 4; as said lots are shown upon that certain map entitled "Record of Survey property of Thoits Bros. Inc., Edward D. Thoits, Trustee and Warren R. Thoits, Trustee being a portion of the Rancho Rincon De San Francisquito in the City of Mountain View, Santa Clara County, California" which map was filed for record on February 4, 1957 in Book 78 of Maps, page 20.

PARCEL TWO:

A non-exclusive easement and right of way for the passage, ingress and egress of motor vehicles and pedestrians over that certain strip of land 30 feet wide and lying 15 feet either side measured at right angles to the following described center line:

PRIVATE RIGHT OF WAY

Commencing on the Easterly sideline of San Antonio Avenue at the most Northerly corner of the 12 1/2 acre parcel described as Parcel 2 in the Deed from Alice F. Maxwell to E.C. Thoits et al, dated January 22, 1949 and recorded January 26, 1949 in Book 1737 of Official Records, page 233, Santa Clara County Records; thence along the Northeasterly boundary of said 12 1/2 acre parcel, South 64° 17' 58" East 315 feet; thence South 25° 36' West and parallel to the Easterly sideline of San Antonio Avenue 143.26 feet; thence south 50° 21' 41" West 49.81 feet; thence South 33° 16' 56" West to the point of intersection with the Southwesterly boundary of the above described Parcel One which said point of intersection is the true point of beginning of this description; thence south 33° 16' 56" West and parallel to the Southeasterly boundary of the aforementioned 12 1/2 acre parcel of land distant therefrom measured at right angles 387.30 feet to a point that lies 15 feet Southwesterly measured at right angles to the common boundary between Lots No. 1 and No. 2 as shown upon that certain Record of Survey Map filed February 4, 1957 in Book 78 of Maps, page 20, Santa Clara County Records.

EXCEPTING THEREFROM that portion of said private right of way lying within the boundaries of that certain 1.089 parcel of land particularly described as follows:

Beginning at an iron pipe set on the Southeasterly line of San Antonio Avenue (50.00 feet in width) distant thereon South 25° 36' West 518.52 feet from an iron pipe set at the point of intersection thereof with the Southeasterly prolongation of the center line of Miller Avenue and from which point of beginning a concrete monument bears South 69° 43' 23" East 0.27 feet; thence from said point of beginning South 25° 36' West along said Southeasterly line of San Antonio Avenue 100.00 feet to an iron pipe; thence at right angles South 64° 24' East 400.00 feet; thence at right angles North 25° 36' East 137.27 feet to a point which bears South 69° 43' 23" East from the point of beginning; thence North 69° 43' 23" West 401.73 feet to the point of beginning.

PARCEL THREE:

A non-exclusive easement for the parking of motor vehicles upon the following described parcels of land:

PARKING AREA 1

Commencing at the point of intersection of the Northeasterly line of the San Francisco-San Jose Road (state highway) now known as El Camino Real as said line was established by the deed from Nellie Ricconi, also known as Nellie F. Ricconi, a widow, to the State of California, dated December 11, 1929, recorded January 16, 1930 in Book 491 of Official Records, page 562, Santa Clara County Records; with the Southeasterly line of that certain 12.45 acre tract of land described as Parcel One in the deed from Alice F. Maxwell to E.C. Thoits et al, dated January 22, 1949, recorded January 26, 1949 in Book 1737 Official Records, page 233, Santa Clara County Records, running thence North 56° 12' 02" West along the said Northeasterly line of San Francisco-San Jose Road 239.79 feet to the true point of beginning, thence continuing along the Northeasterly line of the San Francisco-San Jose Road North 56° 12' 02" West 123.92 feet; thence on a curve to the right with a radius of 75 feet from a tangent to the last named course through a central angle of 81° 48' 02" and a curve length of 107.08 feet; thence on a line parallel to the center line of San Antonio Avenue and distant therefrom 60 feet, measured at right angles, North 25° 36' East 382.17 feet; thence South 56° 43' 04" East, and parallel to the Northeasterly sideline of Lot 1, as shown on that Record of Survey Map filed in Book 78 of Maps, page 20 in the office of the Recorder of the County of Santa Clara, 248.64 feet; thence South 33° 16' 56" West and parallel to the Southeasterly sideline of the aforementioned 12.45 acre parcel, 444.84 feet, more or less, to the true point of beginning.

PARKING AREA 2

Commencing at a point on the Southeasterly sideline of San Antonio Avenue, which point lies South 25° 36' West and along said Southeasterly sideline, 4.15 feet from the intersection of the prolongation Southeasterly of the centerline of Miller Avenue with the aforesaid Southeasterly sideline of San Antonio Avenue as said point and intersection are shown on that certain record of Survey Map recorded in Book 78 of Maps, page 20, Santa Clara County Records, and which point also lies South 25° 36' West and along the aforesaid Southeasterly sideline of San Antonio Avenue 360 feet from the Northernmost corner of that certain 12 1/2 acre tract of land described as Parcel 2 in the Deed from Alice F. Maxwell to E.C. Thoits et al, dated January 22, 1949 and recorded January 26, 1949 in Book 1737 Official Records, page 233, Santa Clara County Records; running thence South 64° 17' 58" East and parallel with the Northeasterly line of said 12 1/2 acre tract 35 feet to the true point of beginning; thence continuing along the same line South 64° 17' 58" East 165 feet; thence South 56° 43' 04" East 55.39 feet; thence South 33° 16' 56" West and parallel to the Southeasterly boundary of said 12 1/2 acre tract, 966.42 feet; thence North 56° 43' 04" West 91.53 feet; thence along a line parallel to the center line of San Antonio Avenue and distant therefrom 60 feet, measured at right angles North 25° 36' East 953.21 feet to the true point of beginning.

EXCEPTING THEREFROM that portion of said private right of way lying within the boundaries of that certain 1.089 parcel of land particularly described as follows:

Beginning at an iron pipe set on the Southeasterly line of San Antonio Avenue (50.00 feet in width) distant thereon South 25° 36' West 518.52 feet from an iron pipe set at the point of intersection thereof with the Southeasterly prolongation of the center line of Miller Avenue and from which point of beginning a concrete monument bears South 69° 43' 23" East 0.27 feet; thence from said point of beginning South 25° 36' West along said Southeasterly line of San Antonio Avenue, 100.00 feet to an iron pipe; thence at right angles South 64° 24' East 400.00 feet; thence at right angles North 25° 36' East 137.27 feet to a point which bears South 69° 43' 23" East from the point of beginning; thence North 69° 43' 23" West 401.73 feet to the point of beginning.

SURVEYOR'S STATEMENT*

TO ARCHON FINANCIAL, L.P., ITS SUCCESSORS AND ASSIGNS, COLLIERIES INTERNATIONAL, AND FIRST AMERICAN TITLE COMPANY:

THIS IS TO STATE THAT THIS MAP OR PLAT AND THE SURVEY ON WHICH IT IS BASED WAS ORIGINALLY PREPARED ON AUGUST 28, 1997 AND WAS REVISED AGAIN, WITH AN "ON THE GROUND SURVEY" ON DECEMBER 19, 2005, UNDER THE UNDERSIGNED'S SUPERVISION AND IN ACCORDANCE WITH "MINIMUM STANDARD DETAIL REQUIREMENTS FOR ALTA/ACSM LAND TITLE SURVEYS," JOINTLY ESTABLISHED AND ADOPTED BY ALTA, ACSM AND NSPS IN 1999, AND INCLUDES ITEMS 2, 3, 4, 6, 7(A), (B) AND (C), 8, 9, 10, 11(A) AND (B), 13, 14 AND 16 OF TABLE A THEREOF. PURSUANT TO ACCURACY STANDARDS AS ADOPTED BY ALTA, NSPS, AND ACSM AND IN EFFECT ON THE DATE OF THIS CERTIFICATION, THE UNDERSIGNED FURTHER CERTIFIES THAT PROPER FIELD PROCEDURES, INSTRUMENTATION, AND ADEQUATE SURVEY PERSONNEL WERE EMPLOYED TO ACHIEVE RESULTS COMPARABLE TO THOSE OUTLINED IN THE "MINIMUM ANGEL DISTANCE, AND CLOSURE REQUIREMENTS FOR SURVEY MEASUREMENTS WHICH CONTROL LAND BOUNDARIES FOR ALTA/ACSM LAND TITLE SURVEYS."

DATE OF LAST REVISION: 12-22-05

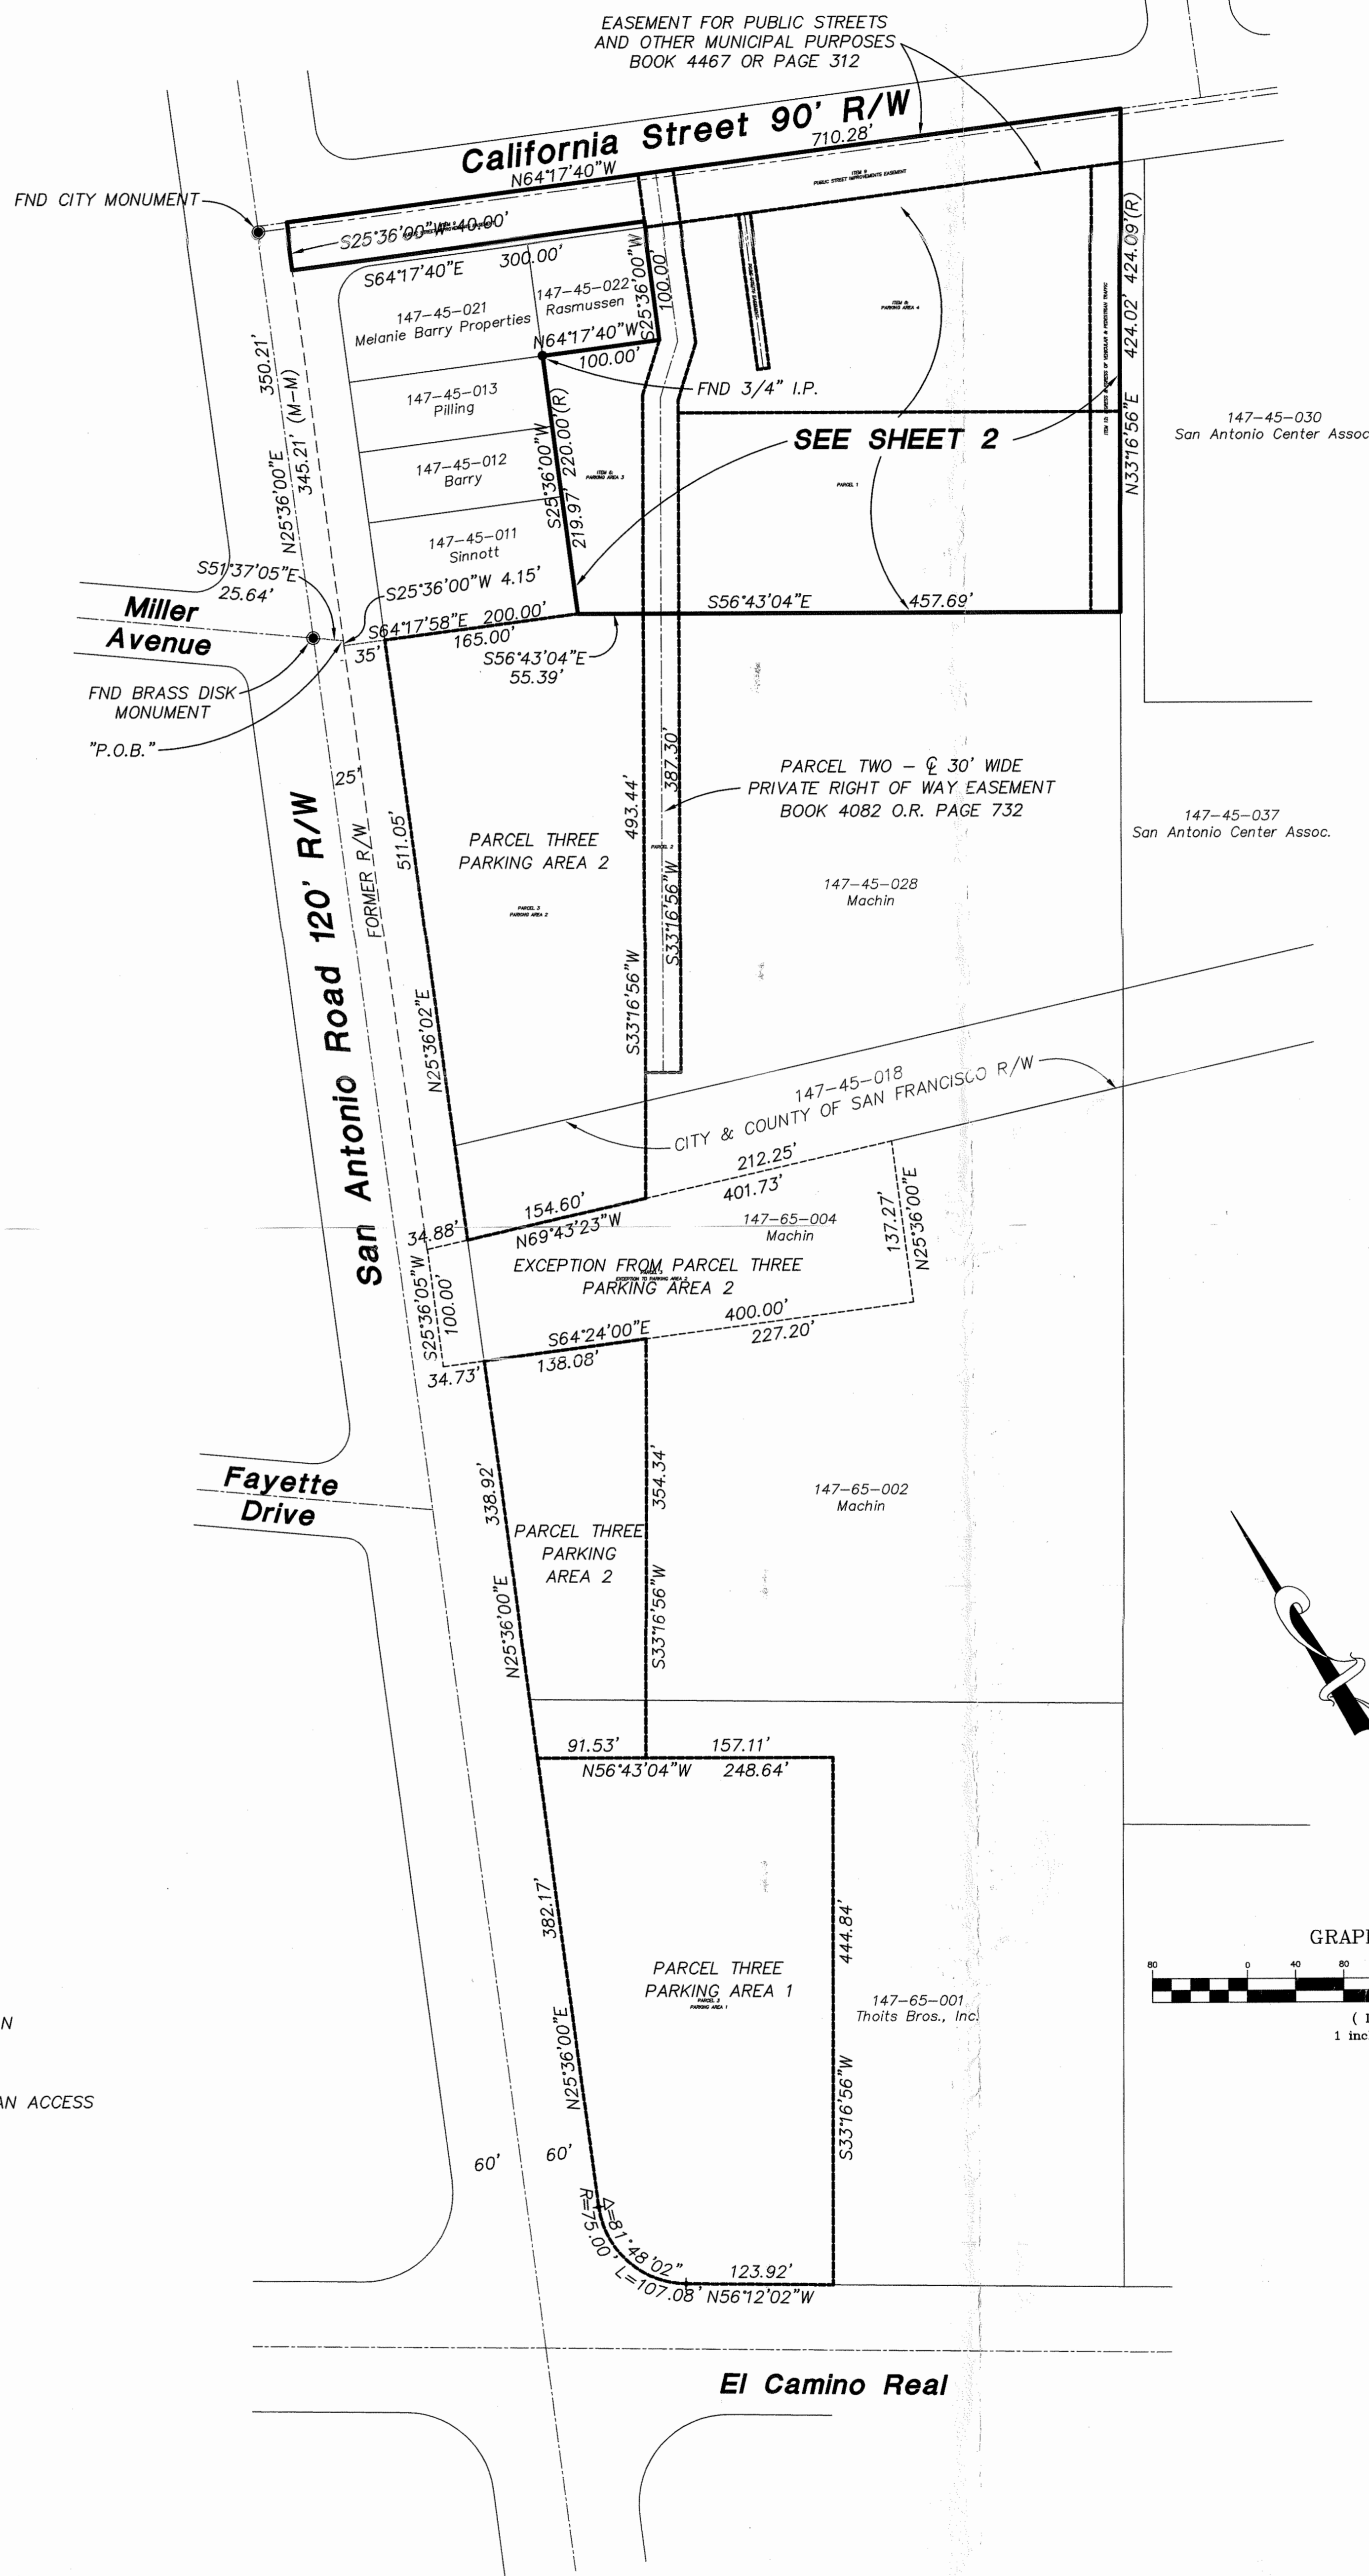

*THE USE OF THE WORD CERTIFY OR CERTIFICATION BY A LICENSED LAND SURVEYOR OR REGISTERED CIVIL ENGINEER IN THE PRACTICE OF PROFESSIONAL ENGINEERING OR LAND SURVEYING OR THE PREPARATION OF MAPS, PLATS, REPORTS, DESCRIPTIONS, OR OTHER SURVEYING DOCUMENTS ONLY CONSTITUTES AN EXPRESSION OF PROFESSIONAL OPINION REGARDING THOSE FACTS OR FINDINGS WHICH ARE THE SUBJECT OF THE CERTIFICATION, AND DOES NOT CONSTITUTE A WARRANTY OR GUARANTEE, EITHER EXPRESSED OR IMPLIED.

NOTES:

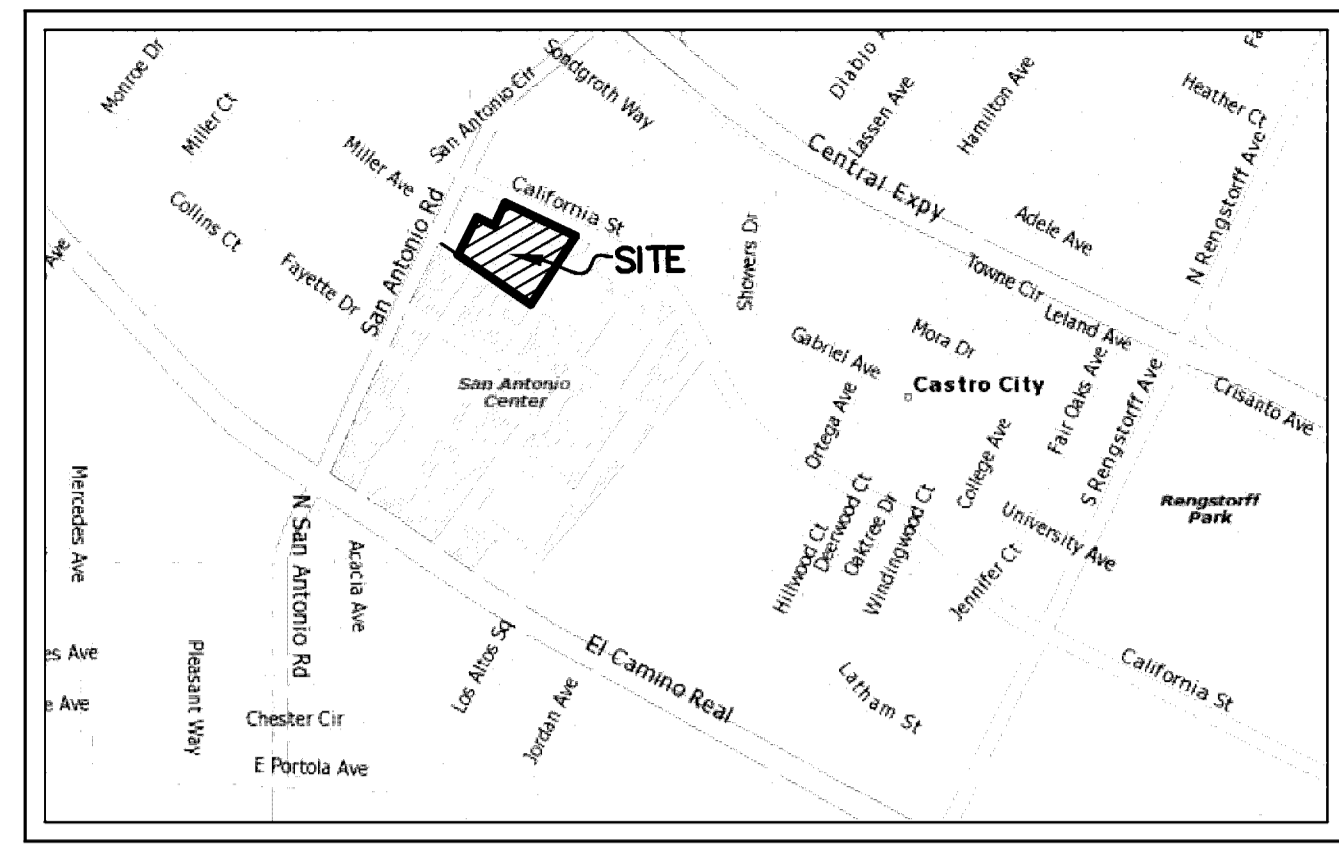

1. THE PROPERTY DESCRIBED ON THIS SURVEY DOES NOT LIE WITHIN A SPECIAL FOOD HAZARD AREA ("SFHA") AS DEFINED BY THE FEDERAL EMERGENCY MANAGEMENT AGENCY; THE PROPERTY LIES WITHIN ZONE(S) X OF THE FLOOD INSURANCE RATE MAP IDENTIFIED AS COMMUNITY PANEL NO. 060347 0002 C, BEARING AN EFFECTIVE DATE OF JULY 4, 1988.
2. THIS SURVEY IS BASED UPON THE PRELIMINARY REPORT PREPARED BY FIRST AMERICAN TITLE COMPANY, DATED NOVEMBER 9, 2005, ORDER NO. NCS-202182-SC.
3. THIS PROPERTY IS LOCATED IN THE SAN ANTONIO SHOPPING CENTER. THEREFORE, THIS SITE IS NOT IN A PARTICULAR ZONING DISTRICT, BUT RATHER IS ZONED IN ACCORDANCE WITH THE "CITY OF MOUNTAIN VIEW SAN ANTONIO CENTER PRECISE PLAN", WHICH WAS ADOPTED BY THE CITY OF MOUNTAIN VIEW ON NOVEMBER 29, 1988, BY RESOLUTION NO. 14888.
4. THIS PROPERTY HAS DIRECT ACCESS TO CALIFORNIA STREET, A PUBLIC RIGHT OF WAY.

PROPERTY DESCRIPTION

Real property in the City of Mountain View, County of Santa Clara, State of California, described as follows:

PARCEL ONE: BEGINNING AT AN IRON PIPE SET AT THE POINT OF INTERSECTION OF THE SOUTHEASTERLY LINE OF SAN ANTONIO AVENUE (50.00 FEET IN WIDTH) WITH THE SOUTHEASTERLY PROLONGATION OF THE CENTER LINE OF MILLER AVENUE; THENCE SOUTH 25° 36' WEST ALONG SAID SOUTHEASTERLY LINE OF SAN ANTONIO AVENUE 4.15 FEET TO AN IRON PIPE SET AT THE NORTHERNMOST CORNER OF LOT 3, AS SAID LOT IS SHOWN UPON THE MAP HERINAFTER REFERRED TO AS "THE MAP"; THENCE SOUTH 64° 17' 58" EAST ALONG A NORTHEASTERLY LINE OF SAID LOT 3, FOR A DISTANCE OF 200.00 FEET TO A PK NAIL IN CONCRETE BASE OF FENCE POST AND THE TRUE POINT OF BEGINNING OF THE PARCEL OF LAND TO BE DESCRIBED; THENCE FROM SAID TRUE POINT OF BEGINNING OF THE PARCEL OF LAND TO BE DESCRIBED; THENCE FROM SAID TRUE POINT OF BEGINNING SOUTH 56° 43'04" EAST ALONG A LINE WHICH IS DRAWN AT RIGHT ANGLES TO THE SOUTHEASTERLY LINE OF LOT 4, AS SAID LOT IS SHOWN UPON THE MAP HERINAFTER REFERRED TO, FOR A DISTANCE OF 457.69 FEET TO A POINT ON SAID SOUTHEASTERLY LINE OF LOT 4, THENCE NORTH 33° 16' 56" EAST ALONG SAID LAST NAMED LINE 424.09 FEET TO AN IRON PIPE SET AT THE EASTERNMOST CORNER OF SAID LOT 4; THENCE NORTH 64° 17' 58" WEST ALONG THE NORTHEASTERLY LINE OF SAID LOT 4, FOR A DISTANCE OF 71.28 FEET TO AN IRON PIPE SET AT THE NORTHERNMOST CORNER OF SAID LOT 4 ON SAID SOUTHEASTERLY LINE OF SAN ANTONIO AVENUE; THENCE SOUTH 25° 36' WEST ALONG SAID SOUTHEASTERLY LINE OF SAN ANTONIO AVENUE 40.00 FEET TO AN IRON PIPE SET AT THE WESTERNMOST CORNER OF SAID LOT 4; THENCE ALONG THE GENERAL WESTERLY LINE OF SAID LOT 4, FOR THE FOLLOWING COURSES AND DISTANCES; SOUTH 64° 17' 58" EAST 300.00 FEET TO AN IRON PIPE, SOUTH 25° 36' WEST 100.00 FEET TO AN IRON PIPE, NORTH 64° 17' 58" WEST 100.00 FEET TO AN IRON PIPE AND SOUTH 25° 36' WEST 148.21 FEET TO THE WESTERLY COMMON CORNER FOR SAID LOTS 3 AND 4; THENCE SOUTH 25° 36' WEST ALONG A NORTHWESTERLY LINE OF SAID LOT 3, FOR A DISTANCE OF 71.79 FEET TO THE TRUE POINT OF BEGINNING, A PORTION OF LOTS 3 AND 4, AS SAID LOTS ARE SHOWN UPON THAT CERTAIN MAP ENTITLED "RECORD OF SURVEY PROPERTY OF THOITS BROS. INC., EDWARD D. THOITS, TRUSTEE AND WARREN R. THOITS, TRUSTEE BEING A PORTION OF THE RANCHO RINCON DE SAN FRANCISCO IN THE CITY OF MOUNTAIN VIEW, SANTA CLARA COUNTY, CALIFORNIA" WHICH MAP WAS FILED FOR RECORD ON FEBRUARY 4, 1957 IN BOOK 78 OF MAPS, PAGE 20.

PARCEL TWO: A NON-EXCLUSIVE EASEMENT AND RIGHT OF WAY FOR THE PASSAGE, INGRESS AND EGRESS OF MOTOR VEHICLES AND PEDESTRIANS OVER THAT CERTAIN STRIP OF LAND 30 FEET WIDE AND LYING 15 FEET EITHER SIDE MEASURED AT RIGHT ANGLES TO THE FOLLOWING DESCRIBED CENTER LINE.

PRIVATE RIGHT OF WAY COMMENCING ON THE EASTERLY SIDELINE OF SAN ANTONIO AVENUE AT THE MOST NORTHERLY CORNER OF THE 12 1/2 ACRE PARCEL DESCRIBED AS PARCEL 2 IN THE DEED FROM ALICE F. MAXWELL TO E.C. THOITS ET AL. DATED JANUARY 22, 1949 AND RECORDED JANUARY 26, 1949 IN BOOK 1437 OF OFFICIAL RECORDS, PAGE 233, SANTA CLARA COUNTY RECORDS; THENCE ALONG THE NORTHEASTERLY BOUNDARY OF SAID 12 1/2 ACRE PARCEL, SOUTH 64° 17' 58" EAST 315 FEET; THENCE SOUTH 25° 36' WEST AND PARALLEL TO THE EASTERLY SIDELINE OF SAN ANTONIO AVENUE 143.26 FEET; THENCE SOUTH 50° 21' 41" WEST 49.81 FEET; THENCE SOUTH 33° 16' 56" WEST TO THE POINT OF INTERSECTION WITH THE WESTERLY BOUNDARY OF THE ABOVE DESCRIBED PARCEL ONE WHICH SAID POINT OF INTERSECTION IS THE TRUE POINT OF BEGINNING OF THIS DESCRIPTION; THENCE SOUTH 33° 16' 56" WEST AND PARALLEL TO THE SOUTHEASTERLY BOUNDARY OF THE AFOREMENTIONED 12 1/2 ACRE PARCEL OF LAND DISTANT THEREFROM MEASURED AT RIGHT ANGLES 387.30 FEET TO A POINT THAT LIES 15 FEET SOUTHWESTERLY MEASURED AT RIGHT ANGLES TO THE COMMON BOUNDARY BETWEEN LOTS NO. 1 AND NO. 2 AS SHOWN UPON THAT CERTAIN RECORD OF SURVEY MAP FILED FEBRUARY 4, 1957 IN BOOK 78 OF MAPS, PAGE 20, SANTA CLARA RECORDS.

EXCEPTING THEREFROM THAT PORTION OF SAID PRIVATE RIGHT OF WAY LYING WITHIN THE BOUNDARIES OF THAT CERTAIN 1.089 PARCEL OF LAND PARTICULARLY DESCRIBED AS FOLLOWS: BEGINNING AT AN IRON PIPE SET ON THE SOUTHEASTERLY LINE OF SAN ANTONIO AVENUE (50.00 FEET IN WIDTH) DISTANT THEREON SOUTH 25° 36' WEST 518.52 FEET FROM AN IRON PIPE SET AT THE POINT OF INTERSECTION THEREOF WITH THE SOUTHEASTERLY PROLONGATION OF THE CENTER LINE OF MILLER AVENUE AND FROM WHICH POINT OF BEGINNING A CONCRETE MONUMENT BEARS SOUTH 69° 43' 23" EAST 0.27 FEET; THENCE FROM SAID POINT OF BEGINNING SOUTH 25° 36' WEST ALONG SAID SOUTHEASTERLY LINE OF SAN ANTONIO AVENUE 100.00 FEET TO AN IRON PIPE; THENCE AT RIGHT ANGLES SOUTH 64° 24' EAST 400.00 FEET; THENCE AT RIGHT ANGLES NORTH 25° 36' EAST 137.27 FEET TO A POINT WHICH BEARS SOUTH 69° 43' 23" EAST FROM THE POINT OF BEGINNING; THENCE NORTH 69° 43' 23" WEST 401.73 FEET TO THE POINT OF BEGINNING.

PARCEL THREE: A NON-EXCLUSIVE EASEMENT FOR THE PARKING OF MOTOR VEHICLES UPON THE FOLLOWING DESCRIBED PARCELS OF LAND; PARKING AREA 1 COMMENCING AT THE POINT OF INTERSECTION OF THE NORTHEASTERLY LINE OF THE SAN FRANCISCO-SAN JOSE ROAD (STATE HIGHWAY) NOW KNOWN AS EL CAMINO REAL AS SAID LINE WAS ESTABLISHED BY THE DEED FROM NELLIE RICCOMI, ALSO KNOWN AS NELLIE F. RICCOMI, A WIDOW, CALIFORNIA, DATED DECEMBER 11, 1928, RECORDED JANUARY 16, 1930 IN BOOK 491 OF OFFICIAL RECORDS, PAGE 562, SANTA CLARA COUNTY RECORDS; WITH THE SOUTHEASTERLY LINE OF THAT CERTAIN 12.45 ACRE TRACT OF LAND DESCRIBED AS PARCEL ONE IN THE DEED FROM ALICE F. MAXWELL TO E.C. THOITS ET AL. DATED JANUARY 22, 1949, RECORDED JANUARY 26, 1949 IN BOOK 1737 OFFICIAL RECORDS, PAGE 233, SANTA CLARA COUNTY RECORDS, RUNNING THENCE NORTH 56° 12' 02" WEST ALONG THE SAID NORTHEASTERLY LINE OF SAN FRANCISCO-SAN JOSE ROAD 239.79 FEET TO THE TRUE POINT OF BEGINNING, THENCE CONTINUING ALONG THE NORTHEASTERLY LINE OF THE SAN FRANCISCO-SAN JOSE ROAD NORTH 58° 12' 02" WEST 123.92 FEET; THENCE ON A CURVE TO THE RIGHT WITH A RADIUS OF 75 FEET FROM A TANGENT TO THE LAST NAMED COURSE THROUGH A CENTRAL ANGLE OF 81° 48' 02" AND A CURVE LENGTH OF 107.08 FEET; THENCE ON A LINE PARALLEL TO THE CENTER LINE OF SAN ANTONIO AVENUE AND DISTANT THEREFROM 60 FEET, MEASURED AT RIGHT ANGLES, NORTH 23° 36' EAST 382.17 FEET; THENCE SOUTH 66° 43' 04" EAST, AND PARALLEL TO THE NORTHEASTERLY SIDELINE OF LOT 1, AS SHOWN ON THAT RECORD OF SURVEY MAP FILED IN BOOK 78 OF MAPS, PAGE 20 IN THE OFFICE OF THE RECORDER OF THE COUNTY OF SANTA CLARA, 248.64 FEET; THENCE SOUTH 33° 16' 56" WEST AND PARALLEL TO THE SOUTHEASTERLY SIDELINE OF THE AFOREMENTIONED 12.45 ACRE PARCEL, 444.84 FEET, MORE OR LESS, TO THE TRUE POINT OF BEGINNING.

PARCEL FOUR: RIGHTS AND EASEMENTS AS GRANTED IN THAT CERTAIN INSTRUMENT ENTITLED "COVENANTS BETWEEN LANDOWNERS" RECORDED MAY 26, 1958 IN BOOK 4082, PAGE 741, OFFICIAL RECORDS.

PARCEL FIVE: RIGHTS AND EASEMENTS AS GRANTED IN THAT CERTAIN INSTRUMENT ENTITLED "RECIPROCAL PARKING AGREEMENT" RECORDED APRIL 11, 1974 IN BOOK 0844, PAGE 698, OFFICIAL RECORDS.

EXCEPTIONS FROM COVERAGE

- 1. General and special taxes and assessments for the fiscal year 2011-2012, a lien not yet due or payable. NOT PLOTTABLE.
2. The lien of supplemental taxes, if any, assessed pursuant to Chapter 3.5 commencing with Section 75 of the California Revenue and Taxation Code. NOT PLOTTABLE.
3. The terms and provisions contained in the document entitled "Deed" recorded January 21, 1952 in Book 2352, Page 558 of Official Records.
4. An easement for non-exclusive easement of right of way for the passageway, ingress and egress of pedestrians and motor vehicles and incidental purposes, recorded May 26, 1958 in Book 4082, Page 717 in favor of T.B.I. Properties, Inc. and May 26, 1958 in Book 4082, Page 732, both of Official Records. In Favor of: San Antonio Development Co., a limited partnership Affects: As described therein PLOTTED.
5. An easement for non-exclusive easement and license to park motor vehicles and incidental purposes, recorded May 26, 1958 in Book 4082, Page 717 in favor of T.B.I. Properties, Inc. and May 26, 1958 in Book 4082, Page 732, both of Official Records. In Favor of: San Antonio Development Co., a limited partnership Affects: As described therein PLOTTED.
6. Terms and conditions in the deeds recorded May 26, 1958 in book 4082, Page 717 and May 26, 1958 in Book 4082, Page 732 official Records, as follows: "The easements granted hereunder and those excepted and reserved hereunder shall each expire on March 31, 2008 or the date of the termination of the initial or any renewal term of the existing lease, as the same may be amended, pertaining to the portion of the above mentioned balance of grantors land adjoining the parcel conveyed hereunder, whichever is the later dated, the said lease being May 5, 1953 between the grantor hereunder as lessor and Northcutt Lumber Company as lessee and a memorandum of which was recorded May 29, 1953 in Book 2654 Official Records of Santa Clara County, California, at Page 61" Said matter affects Parcel Three and Four and the easements shown in the last two items. TERMS AND PROVISIONS, NOT PLOTTABLE.
7. Covenants, conditions, restrictions and easements in the document recorded May 26, 1958 in Book 4082, Page 741 of Official Records, but deleting any covenant, condition or restriction indicating a preference, limitation or discrimination based on race, color, religion, sex, handicap, familial status, national origin, sexual orientation, marital status, ancestry, source of income or disability, to the extent such covenant conditions or restrictions violate Title 42, Section 3604(c), of the United States Codes. Local restrictions under state and federal law on the age of occupants in senior housing or housing for older persons shall not be construed as restrictions based on familial status. TERMS AND PROVISIONS, NOT PLOTTABLE.
8. An easement for public street and other municipal purposes and incidental purposes, recorded July 1, 1959 in Book 4467, Page 312 of Official Records. In Favor of: City of Mountain View California street PLOTTED.
9. The terms and provisions contained in the document entitled "Reciprocal Parking Agreement" recorded April 11, 1974 in Book 0844, Page 698 of Official Records. Which, among other things, provides: for the development of a unified shopping area with common exits, entrances, parking areas and walkways. Additional rights or limitations affecting said land provided in the above instrument as follows: A) Building and Competition Restrictions Assignment of REA Interest in favor of J.C. Penney Company, Inc., a Delaware corporation recorded September 24, 1984 in Book 1907, Page 421, Official Records. TERMS AND PROVISIONS, NOT PLOTTABLE.
10. An easement for ingress and egress of vehicular and pedestrian traffic and incidental purposes, recorded April 11, 1974 in Book 0844, Page 721 of Official Records. In Favor of: Century 72 & Johnson Associates, a joint venture, Lillian F. Week, an individual and Pine & Co., a partnership The Southeasterly 25 feet Affects: PLOTTED.
11. An easement for utilities and incidental purposes, recorded August 25, 1987 in Book 270, Page 766 of Official Records. In Favor of: Pacific Gas and Electric Company, a California corporation As described therein PLOTTED.
12. An unrecorded lease dated June 30, 1989, executed by Western Investment Real Estate Trust as lessor and Ross Stores Inc. as lessee, as disclosed by a Memorandum of Lease recorded October 24, 1989 in Book L138, Page 2224 of Official Records. Defects, liens, encumbrances or other matters affecting the leasehold estate, whether or not shown by the public records. MEMORANDUM OF LEASE, NOT PLOTTABLE.
13. The terms and provisions contained in the document entitled "Agreement of Co-operation to Establish Mutual Access Rights among Adjoining Property Owners upon Future Development" recorded August 9, 1990 in Book L444, Page 671 of Official Records. AS NOTED ON SURVEY.
14. The terms and provisions contained in the document entitled "Agreement Regarding Mutual Pedestrian Access" recorded December 10, 1990 in Book L562, Page 480 of Official Records. ACCESS POINT, PLOTTED.
15. The terms and provisions contained in the document entitled "Agreement Approving Uses and Granting Signage Rights" recorded August 11, 1997 as Instrument No. 13807467 of Official Records. SIGN LOCATION AS SHOWN AND NOTED ON SURVEY.
16. A Deed of Trust to secure an original indebtedness of \$6,500,000.00 recorded December 30, 2005 as Instrument No. 18750953 of Official Records. Dated: December 29, 2005 Trustor: Machado-San Antonio Partners, LLC, a California limited liability company Trustee: First American Title Insurance Company Beneficiary: Goldman Sachs Commercial Mortgage Capital, L.P., a Delaware limited partnership A document entitled "Assignment of Leases and Rents" recorded December 30, 2005 as Instrument No. 18750954 of Official Records, as additional security for the payment of the indebtedness secured by the deed of trust. The Interest of Goldman Sachs Commercial Mortgage Capital, L.P., a Delaware limited partnership under said Assignment of Leases and Rents was purportedly assigned to Bank of America, N.A., as Trustee for the Registered Holders of GS Mortgage Securities Corporation II, Commercial Mortgage Pass-Through Certificates, Series 2006-G06 by various documents, the last of which recorded November 23, 2009 as Instrument No. Instrument No. 20517127 of Official Records. According to the public records, the beneficial interest under the deed of trust was assigned to Bank of America, N.A., as Trustee for the Registered Holders of GS Mortgage Securities Corporation II, Commercial Mortgage Pass-Through Certificates, Series 2006-G06 by various assignments, the last of which recorded November 23, 2009 as Instrument No. 20517126 of Official Records. NOT PLOTTABLE.
17. A financing statement recorded December 30, 2005 as Instrument No. 18750955 of Official Records. Debtor: Machado-San Antonio Partners, LLC Secured party: Goldman Sachs Commercial Mortgage Capital, L.P. According to the public records, the security interest of the secured party was assigned to Bank of America, N.A., as Trustee for the Registered Holders of GS Mortgage Securities Corporation II, Commercial Mortgage Pass-Through Certificates, Series 2006-G06 by document recorded November 23, 2009 as Instrument No. 20517128 of Official Records. A continuation statement was recorded September 9, 2010 as Instrument No. 20863892 of Official Records. NOT PLOTTABLE.
18. The terms and provisions contained in the document entitled "Memorandum of License Agreement" recorded April 28, 2006 as Instrument No. 18910436 of Official Records. TERMS AND PROVISIONS, NOT PLOTTABLE.
19. This item has been intentionally deleted. NOT PLOTTABLE.
20. Rights of parties in possession. NOT PLOTTABLE.

RE: Limited Phase II Soil Investigation
455 San Antonio Road
Mountain View, CA

Dear Ms. Macklin:

This report presents the results of the recent completion of five exploratory soil borings at the above-referenced Property. The purpose of this work was to determine whether the subsurface soils beneath the Property have been impacted from possible leakage from the underground storage tanks (USTs) for the existing hydraulic hoists.

The scope of the work performed by PIERS for this investigation consisted of the following: completion of five exploratory soil borings using a Geoprobe drill rig provided by Vironex of San Leandro, California; collection of soil samples; submission of the samples for chemical analysis; data analysis and interpretation; and preparation of this report.

SITE DESCRIPTION AND BACKGROUND

The Property is located on the southeastern side of S. San Antonio Road, a short distance northeast of the intersection with El Camino Real, in the City of Mountain View, Santa Clara County, California. A Site Vicinity Map and a Property Site Plan are attached to this report as Figures 1 and 2, respectively.

RECENT FIELD ACTIVITIES

On January 13, 2005, five soil borings were installed at the Property. The borings were located as close as possible to five of the eleven underground hoists. The locations of the borings are shown on Figure 2.

Prior to drilling, the boring locations were marked with white paint and Underground Services Alert was notified. Also, a site-specific Health and Safety Plan (HSP) was prepared. A safety meeting was held on site prior to the start of drilling and the HSP was reviewed and discussed.

A concrete coring tool with a four-inch bit was used at each location to core through the slab. Following this, a hand auger tool was first used in the uppermost boring to insure that there were no conflicts with underground utilities. Following this, a Geoprobe was used to continuously core the soils to a depth of approximately 15 feet. No obvious evidence of contamination such as staining or odors was observed at any of the boring locations.

At each boring, a soil sample was retained from approximately 14 feet below grade. The soil sample selected for analyses was cut from the plastic liner within the drilling rods, sealed with Teflon-lined plastic caps and placed in individually sealed plastic bags. The samples were then labeled and stored in a cooler, on ice, prior to same day delivery to a state-certified laboratory under Chain of Custody documentation.

Upon completion of drilling, each location was sealed with neat cement grout. The hand-augered soils were placed back within the uppermost few feet of each boring. A quick setting concrete was used to seal the boring at the surface to match the existing floor condition.

The subsurface conditions encountered generally consisted of sandy to clayey silt with varying amounts of gravel (alluvium). Groundwater was not encountered. The soil cuttings were retained in five-gallon pails pending the results of the laboratory analyses

All sampling tools were decontaminated between each use by triple rinsing with a non-phosphate detergent and water. The decontamination water was contained and properly disposed of off site by the driller.

ANALYTICAL RESULTS

The soil samples were analyzed by McCampbell Analytical Laboratory in Pacheco, California, a California state-certified Hazardous Material Testing Laboratory. All samples analyzed were accompanied by properly executed Chain of Custody documentation. The soil samples were analyzed for Total Petroleum Hydrocarbons (TPH) as hydraulic fluid by EPA Method 8015, and for PCB's by EPA Method 8082.

All of the analytical results for the soil samples indicated non-detectable concentrations of the analytes. Copies of the laboratory analyses and the Chain of Custody documentation are attached to this report.

CONCLUSIONS AND RECOMMENDATIONS

Based on the non-detectable results for the soil samples, the hydraulic hoists investigated at the Property do not appear to have impacted the subsurface soils, and no further investigation is considered warranted.

LIMITATIONS

The observations and conclusions presented in this report are professional opinions based on the scope of work outlined herein. This report was prepared in accordance with generally accepted standards of environmental geological practice in California at the time this investigation was performed. The opinions presented apply to site conditions existing at the time of our study and cannot apply to site conditions or changes of which we are not aware or have not had the opportunity to evaluate. This investigation was conducted solely to evaluate environmental conditions beneath the Property at specific locations. Subsurface conditions may vary away from the data points available. Additional work, including subsurface investigation, can reduce the inherent uncertainties associated with this type of investigation. It must be recognized that any conclusions drawn from these data rely on the integrity of the information available at the time of investigation and that a full and complete determination of environmental contamination and risks cannot be made.

If you have any questions regarding this report, please do not hesitate to contact our office.

Sincerely,
PIERS Environmental Services, Inc.

Executive Summary

TOR Environmental, Inc. (TOR) was retained by Glaser Weil Fink Jacobs Howard Avchen & Shapiro LLP (Glaser Weil) on behalf of MGP IX REIT LLC (MGP) to prepare a Phase I Environmental Site Assessment (Phase I ESA) for San Antonio Center located at 455 San Antonio Road, Mountain View, California 94040 (Figure 1). For the purpose of this report the San Antonio Center property will be referred to as the "Subject Property". San Antonio Center is also identified by Santa Clara County Assessor Parcel Numbers 148-20-001 – 004, 148-22-001, 148-22-002, and 148-22-008 and consists of approximately 16.34 acres of improved land.

The Phase I ESA was conducted on behalf of Glaser Weil and MGP as part of a financial transaction with Wells Fargo and all will be referred to as the User throughout this report. This Phase I ESA will provide the User with a baseline understanding of environmental conditions present at the Subject Property using the guidelines set forth in the American Society of Testing and Materials (ASTM) Practice E 1527-05 standard practice.

The purpose of this Phase I ESA is to identify recognized environmental conditions ("RECs"), as defined by ASTM Practice E-1527-05 that may have affected the Subject Property. Findings that are not RECs, but do have some potential to have affected the Subject Property are identified as Notable Findings for the purpose of this report.

As defined by ASTM, a REC is "the presence or likely presence of any hazardous substance or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substance or petroleum products into the structure, on the property, or into the ground, groundwater, or surface water of the property." The term *historical recognized environmental condition* means an environmental condition which in the past would have been considered a *recognized environmental condition*, but which may or may not be considered as a *recognized environmental condition* currently.

Conclusions

The San Antonio Center was constructed in the late 1950's on agricultural property approximately 16.34 acres in size. The Subject Property includes four (4) commercial retail structures totaling approximately 230,000 square feet of floor space. These improvements were actively being demolished during the implementation of this environmental site assessment.

The Sears Auto Center and Quality Tune Up facilities represent historic RECs; however, environmental assessment and remediation performed over the past two (2) decades and subsequent regulatory involvement and approval of the work has mitigated the RECs associated with the Subject Property today. Groundwater sampling and chemical analysis around the perimeter of the 455 San Antonio Road building suggests that both onsite and offsite releases of hazardous waste have not impacted groundwater at the locations tested. No businesses in the vicinity were identified on regulatory agency databases or during the site visit as having the potential to cause soil or groundwater contamination beneath the Subject Property.

Recommendations

Based on the conclusions provided above, TOR does not recommend further environmental evaluation for the Subject Property at this time. TOR recommends the property owner continue to monitor Sears' activities until the company vacates the property and that all submittals to environmental regulatory agencies are collected for the Subject Property's historical record. Further, the owner should verify and document that regulatory closures for the redevelopment are issued by the appropriate agencies.

Section 1: Introduction

TOR Environmental, Inc. (TOR) was retained by Glaser Weil Fink Jacobs Howard Avchen & Shapiro LLP (Glaser Weil) on behalf of MGP IX REIT LLC (MGP) to prepare a Phase I Environmental Site Assessment (Phase I ESA) for San Antonio Center located at 455 San Antonio Road, Mountain View, California (Figure 1). For the purpose of this report, the San Antonio Center property will be referred to as the “Subject Property”. San Antonio Center is also identified by Santa Clara County Assessor Parcel Numbers 148-20-001 – 004, 148-22-001, 148-22-002, and 148-22-008, and consists of approximately 16.34 acres of improved land.

This Phase I ESA was conducted on behalf of Glaser Weil and MGP as part of a financial transaction with Wells Fargo and all will be referred to as the User throughout this report. This Phase I ESA will provide the User with a baseline understanding of environmental conditions present at the Subject Property using the guidelines set forth in the American Society of Testing and Materials (ASTM) Practice E 1527-05 standard practice.

1.1 Purpose

The purpose of this Phase I ESA is to identify *recognized environmental conditions* (“RECs”), as defined by ASTM Standard Practice E 1527-05, that may have affected the Subject Property. Findings that are not RECs, but do have some potential to have affected the Subject Property are identified as Notable Findings for the purpose of this report.

As defined by the ASTM, a REC is “the presence or likely presence of any hazardous substance or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substance or petroleum products into the structure, on the property, or into the ground, groundwater, or surface water of the property.” The term *historical recognized environmental condition* means an environmental condition which in the past would have been considered a *recognized environmental condition*, but which may or may not be considered as a *recognized environmental condition* currently.

The work was conducted pursuant to authorization to proceed with the project dated 28 June 2011 from Mr. Daniel G. Jordan, Esq. of Glaser Weil.

1.2 Detailed Scope of Services

1.2.1 Phase I ESA

The Phase I ESA was conducted in general accordance with the United States Environmental Protection Agency (USEPA) All-Appropriate Inquiry (AAI) rule (40 CFR, Part 312) as described in the ASTM Standard Practice E 1527-05 for the performance of a Phase I ESA. At a minimum, the following activities were performed to accomplish the Phase I ESA objectives:

- **Subject Property Reconnaissance** – A visual and physical observation of the Subject Property was conducted in readily accessible areas to identify RECs or Notable Findings associated with environmental conditions. Additionally, visual observations of adjoining properties were made from the vantage point of the Subject Property as well as from public right-of-ways to assess the potential impact of these properties on the Subject Property.

- **Subject Property Representative Interview** – An interview was conducted with individuals knowledgeable and familiar with the Subject Property.
- **Environmental Lien Search** – An environmental lien is a charge, security, or encumbrance on a property's title to secure payment of cost or debt arising from response actions, cleanup, or other remediation of hazardous substances or petroleum products. An environmental lien search was conducted and no environmental liens or Activity and Usage Limitations (AULs) were reported by the User.
- **Online Agency Records Review** – Available environmental reports, agency records (state and local agencies), and appropriate permits were reviewed to identify any reported environmental concern or incident associated with the Subject Property.
- **Historical Research** – At a minimum, readily available sources of historical information related to the Subject Property and adjoining properties were researched to identify historical land use practices that have the potential to adversely impact environmental conditions at the Subject Property. Sources of historical information to help identify RECs or Notable Findings in connection with the Subject Property include historical aerial photographs, historical topographic maps, Sanborn Fire Insurance Maps, and City Directories.
- **Government Database Review** – Published governmental federal and state databases were reviewed to identify properties within ASTM-specified radii of the Subject Property with a reported environmental concern or incident. TOR subcontracted the compilation of government database search to Environmental Data Resources, Inc. (EDR).
- **Report Preparation** – This written summary of the findings and recommendations of the Phase I ESA was prepared.

1.3 Environmental Professional Qualifications

This Phase I ESA was prepared under the supervision of Jeffrey D. Borum (PG 4149, EG 1330) of TOR. Mr. Borum has a Bachelor of Science degree in Earth Science, a Master of Science degree in Geology, and is a California Professional Geologist with 30 years of professional experience. Mr. Borum meets the qualifications for an environmental professional as stated in the ASTM Practice E 1527-05 standard.

1.4 Limitations and Exceptions

This Phase I ESA is based on review of readily available environmental records, results of limited interviews, and visual observations of recent Subject Property conditions. The collection or analysis of environmental samples; surveys regarding the presence of asbestos, radon, heavy metal-based paints; or compliance of individual property operations with environmental regulations were not executed during this Phase I ESA. This assessment was not intended to be a comprehensive inspection or assessment of all conditions that might exist at the Subject Property. Findings were developed based on our professional opinion and do not represent a

warranty, guarantee, certification, or positive assertion as to the presence, absence, or extent of potential contamination. TOR's activities were conducted in accordance with practices and procedures generally accepted in the consulting field. TOR's services were limited to those specified in our proposal, which was accepted and authorized by Glaser Weil and MGP.

1.5 Special Terms and Conditions

This report represents TOR's professional opinion and judgment, which are dependent upon information obtained during performance of consulting services. Environmental conditions may exist at the Subject Property that cannot be identified by visual observations or were obscured from view by vegetation, poor lighting, or other materials during TOR's visit to the Subject Property. TOR's conclusions were based in part on information supplied by others, the accuracy or sufficiency of which has not been independently reviewed by TOR. No investigation can be thorough enough to exclude the presence of hazardous materials at a given Subject Property; therefore, if no hazardous materials are identified during an assessment, such a finding should not be construed as a guarantee of the absence of such materials on the Subject Property, but rather the results of services performed within project scope, cost, schedule, and other limitations.

Any opinions presented apply to the Subject Property conditions at the time of performance of services and do not address the potential for future releases. Changes in applicable environmental standards, practices, or regulations may occur following performance of services, which could impact the opinions presented.

1.6 Reliance

This report is intended for the sole use of Glaser Weil, MGP, affiliates of MGP and Wells Fargo. If other parties wish to rely on this report, please have them contact TOR so that a mutual understanding and agreement of the terms and conditions for our services can be established prior to their use of this information.

Section 2: Subject Property Description

The following section provides information about the Subject Property, such as its ownership, general description, environmental setting, current property usage, and also describes the general uses of the adjoining properties and surrounding area.

2.1 Property Owner Information

Merlone Geier Partners, L.P. is the current owner of the Subject Property. The Subject Property includes Assessor Parcel Numbers (APNs) of 148-20-001 – 004, 148-22-001 and 148-22-002, 148-22-008.

2.2 Subject Property Description

The Subject Property is part of the San Antonio Center and is situated in a primarily commercial area of Mountain View, California. Four buildings located on the Subject Property are used as commercial retail space for the western portion of the San Antonio Center. Of the six retail spaces within the four buildings of the Subject Property, only one is currently occupied. TOR understands that final space (455 San Antonio Road) is scheduled to be vacated in July 2011. The other buildings (445, 635-685 San Antonio Road) have already been vacated as a part of redevelopment and are currently being demolished and removed from the site. The redevelopment will include the construction of a new mixed-use commercial/residential complex with underground parking in the area formerly occupied by the Sears retail building.

Historically all the buildings on the Subject Property have been used for commercial retail purposes. The 635-685 San Antonio Rd. building, 2580 W. El Camino Real building, and 455 San Antonio Rd. building were constructed in the mid to late 1950s and the Sears Auto Center was finished in the mid-1960s.

San Antonio Center's main retail spaces were occupied by Sears Auto Shop, Sears (retail store), and most recently by Burger King, Rite Aid, Party Time, Sports Authority and Quality Tune Up. Buildings on the Subject Property were constructed from the late 1950s to the late 1960s. Parking and loading areas are located on the west and south side of the Subject Property. Aside from minor landscape strips, surface coverage for the Subject Property consists of asphalt or concrete.

A more detailed description of each of the four buildings located on the Subject Property and their current use is provided below. The description starts from the northern-most building and continues towards the south.

Sears Auto Center (445 San Antonio Road, Mountain View, California)

The Sears Auto Center is a one-story building with a footprint of approximately 15,140 sf. The building also includes a partial basement of about 7,200 sf. This full service automotive facility contains a customer lobby, office and storage spaces, and a service garage located on the ground level. Eleven hydraulic lifts and one electric lift were housed in the service bay of the garage until the beginning of 2011 when they were excavated and disposed by the Sears. Sumps and drains were reportedly sealed in the late 1980s to prevent discharge potentially

hazardous substances to the storm water or sewer system. Other preventative and remedial measures were implemented over the years (Appendix G).

Sears Retail Store (455 San Antonio Road, Mountain View, California)

The Sears Retail Store (Sears) building is a two-level structure and operates as a retail clothing store. The upper level serves as retail space and the lower level is a basement. The basement is primarily used for the storage of miscellaneous materials and mechanical equipment used to operate the store. The Sears building contains transformers, furnaces, florescent lighting, asbestos containing materials and other potentially hazardous materials that have been located, inventoried and incorporated into the redevelopment plans for the Subject Property (Appendix G).

Co-op Building (635, 645, 665, and 685 San Antonio Road, Mountain View, California)

The Co-op Building has four retail spaces that were recently occupied by Sports Authority, Burger King, Party City and Rite Aid. These spaces have been inventoried for hazardous materials and their handling and disposal during redevelopment have been incorporated into the project plan (Appendix G).

2.3 Adjoining Properties and Surrounding Vicinity

A generalized description of the surrounding area is as follows:

North: California Street bounds the Subject Property to the north where various retail stores front the street. Properties of interest include: Valero Gas Station. The names and addresses of adjacent businesses along California Street (some have San Antonio Rd. addresses) immediately to the north of the Subject Property include:

BUSINESS NAME	ADDRESS
Valero Gas Station	334 San Antonio Road
Vacant	365 San Antonio Raod
Barron Park Plumbing	377 San Antonio Raod
La Fiesta Super Mrkt.	391 San Antonio Road
Oh My Sushi	2595 California Street
Kumon	419 San Antonio Road
Mexican Restaurant	2585 California Street

Milk Pail Market	2575 California Street
Ross Dress for Less	405 San Antonio Road
BevMo	423 San Antonio Road
24 Hour Fitness	2535 California Street

East: Various retail shops within the San Antonio Center accessed off of Showers Drive include: Trader Joe's, Walmart, and American Male store. The names and addresses of adjacent businesses to the Subject Property on Showers Drive include:

BUSINESS NAME	ADDRESS
Japan Dioso Store	550 Showers Drive
24 Hour Fitness	550 Showers Drive
Carter's	550 Showers Drive
Nails 4 U	550 Showers Drive
Sketchers	560 Showers Drive
Vacant	560 Showers Drive
Vacant	570 Showers Drive
Trader Joe's	590 Showers Drive
Krungthai Restaurant	590b Showers Drive
Gamestop	510 Showers Drive
Kohl's	350 Showers Drive
WalMart	600 Showers Drive

West: Retail shops and restaurants are across San Antonio Road. Properties of note on the western perimeter include: Firestone Tire Shop, and Camaro Cleaners (formerly Holiday Cleaners). The names and addresses of businesses adjacent to the Subject Property include:

BUSINESS NAME	ADDRESS
Valero Gas Station	334 San Antonio Road
Dittmer's Gourmet Meats	400 San Antonio Road #4

Masa's Sushi	400 San Antonio Road
Firestone Tires	462 San Antonio Road
Citibank	610 San Antonio Road
Carpeteria	612 San Antonio Road
Cort Furniture	614 San Antonio Road
Rasputin's Music	630 San Antonio Road
DB Shoes	630 San Antonio Road
La Salsa	660 San Antonio Road #A
Camaro Cleaners	660 San Antonio Road #B
CVS Pharmacy	648 San Antonio Road
Dentist	646 San Antonio Road
Optometrist	644 San Antonio Road
Penninsula Beauty Supply	640 San Antonio Road
Little Ceasar's Pizza	638 San Antonio Road
Lettuce Sandwich Shop	634 San Antonio Road
Wells Fargo Bank	2600 El Camino Real

South: Retail shops and restaurants adjacent to the Subject Property across El Camino Real include Peet's Coffee & Tea, Prodigy Martial Arts, Angel's Hair and Nails, 123 Acupuncture. Properties of note along the southern perimeter include Fashion Cleaners (formerly Skyline Cleaners). The names and addresses of businesses adjacent to the Subject Property along El Camino Real include:

BUSINESS NAME	ADDRESS
Fashion Cleaners (formerly Syline Cleaners)	4600 El Camino Real Ste. 107
Prodigy Martial Arts	4600 El Camino Real Ste. 104
Lana's European Body Care	4600 El Camino Real Ste. 102

Angel's Hair and Nails	4600 El Camino Real Ste. 106
Peet's Coffee & Tea	4598 El Camino Real
123 Acupuncture	4646 El Camino Real

2.4 Environmental Setting

This section describes the geologic and hydrogeologic features in the region surrounding and beneath the Subject Property.

2.4.1 Regional Geology

The Santa Clara Valley is a geologic structural trough formed within the confines of the San Andreas Fault system in the San Francisco Bay area. The valley is bounded on the southwest by the Santa Cruz Mountains and the San Andreas Fault, and on the northeast by the Diablo Range and the Hayward Fault. The Subject Property is underlain by Holocene continental alluvial and bay deposits. Plio-Pleistocene poorly sorted and stratified alluvial gravels, sands, silts and clays of the Santa Clara Formation underlie the Holocene deposits. These geologic formations evolved as a result of the uplift and erosion of the bordering Coast Range. Lithologic similarities make distinction of these two units difficult (DWR 1975). The two geologic formations unconformably overlie non-water bearing folded Tertiary rocks (CDMG, 1966).

Land uplift and subsidence in Santa Clara Valley due to the recharge and withdrawal of groundwater is well documented by several public agencies such as the Santa Clara Valley Water District (SCVWD) and the USGS (Poland and Ireland, 1988). An increase in the withdrawal of water from the Santa Clara Formation aquifer and a decrease in rainfall for the first half of the twentieth century resulted in a substantial drop in well levels and corresponding land subsidence of approximately 13 feet. Subsidence in the Mountain View area between 1934 and 1967 is shown between 4 and 6 feet. Recovery efforts over the past quarter century, such as the import of water from outside sources and the construction of percolation ponds, have allowed water levels to partially recover in more permeable areas of the aquifer system. Recovery has not occurred where silt and clay soil structures have collapsed. The Subject Property is situated greater than 100-150 feet above the northern extent of the confined aquifer system.

Groundwater at the Subject Property is reportedly found at approximately 20 feet below the ground surface (bgs) (Appendix G).

2.4.2 Hydrogeologic Information

Groundwater information for the Subject Property and surrounding area was not provided in EDR GeoCheck – "Hydrogeologic Information" summary. The "Aquiflow Information System" (Aquiflow®) indicates groundwater flows generally to the northeast based on information from ½-1 mile east southeast of the Subject Property. Review of soil and groundwater characterization information included in reports provided by the owner (Appendix G) and posted on the GeoTracker website for the Subject Property indicates groundwater flows predominantly in a northerly direction (Appendix J).

The unconsolidated Holocene clays silts and sands that underlie the Subject Property are the upper confining layer for the groundwater aquifer estimated to be at approximately 100-150 feet bgs. Artesian springs and flowing wells were common in the area prior to development and extraction as a water supply. Groundwater is unconfined around the valley margins and recharge of the confined aquifer is dependent on infiltration in these areas.

Groundwater information for the Subject Property and surrounding area was provided in an assessment of groundwater relating to a former underground storage tank release at 2585 El Camino Real on the south side of San Antonio Center (Subject Property). Seven groundwater monitoring wells installed in this area recorded groundwater elevations between approximately 44.47 feet above mean sea level (amsl) and 43.98 feet amsl. Groundwater flowed towards the north (Ground Zero Analysis, 1996). The topography at the Subject Property slopes gently to the north and east and groundwater flow direction appears to mimic surface topography.

Groundwater was encountered in all four subsurface penetrations installed as a part of the assessment of soil and groundwater completed by KEH & Associates around the current Sears Building at 455 San Antonio Road (Appendix G). The depth at which groundwater was encountered varied around approximately 20 feet bgs (42.20 amsl) at this location. Careful observation of soil cores extracted through the water bearing zone suggest more permeable sands occur as discontinuous layers within the gravelly silty clay dominate the upper 25 feet (Appendix A). The elevation of groundwater in this area of the Subject Property is very close to the elevation of groundwater observed at the Quality Tune Up site at 2580 El Camino Real.

2.5 Public Water Wells

According to the "EDR Geocheck" (Appendix A), Federal United States Geological Survey (USGS) well information lists two (2) groundwater wells within a mile of the Subject Property. One of the wells is located between $\frac{1}{4}$ - $\frac{1}{2}$ mile south southwest and the other well is located $\frac{1}{2}$ -1 mile south southeast of the Subject Property. The Federal FRDS Public Water Supply System Information does not list any public water supply wells within a mile of the Subject Property.

Seventeen (17) State of California wells are included on the database listing. Thirteen (13) of these wells are located between $\frac{1}{4}$ and $\frac{1}{2}$ mile west southwest and four (4) between $\frac{1}{2}$ and 1 mile east southeast of the Subject Property. "EDR Geocheck" figure showing water wells in the area is included in Appendix A. These wells appear to be or to have been monitoring wells for groundwater quality. Several of the wells are listed as having been destroyed as is common, when assessment and remediation sites are closed by the regulatory agencies. Other wells could be used for industrial purposes and may influence hydraulic gradient at the Subject Property.

The status of each well and other relevant data are also provided in Appendix A.

2.6 Oil and Gas Wells

Based on TOR's review of maps provided by the State of California Department of Conservation Division of Oil, Gas, & Geothermal Resources (DOGGR) and the EDR Geocheck (Appendix A), no active or plugged oil and gas or geothermal wells are located within a one-mile radius of the Subject Property.

Section 3: Government Database Review

A review of federal, state, and tribal environmental databases related to the Subject Property and surrounding area in accordance with the ASTM E 1527-05 search radius was conducted to identify potential RECs. Properties listed have, or might have, the potential for existing or future site contamination, environmental liabilities, or the potential for contamination migration to surrounding areas. Information from these various databases was compiled by EDR and presented in the Radius Map Report (Appendix A).

Government database listings reviewed during this Phase I ESA included, but were not limited to:

- USEPA National Priorities List (NPL) within a 1-mile radius;
- USEPA Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS) sites within a ½-mile radius;
- USEPA Comprehensive Environmental Response-No Further Remedial Action Planned (CERC-NFRAP) sites within a ¼-mile radius;
- USEPA Corrective Action Report (CORRACTS) sites within a 1-mile radius;
- USEPA Resource Conservation and Recovery Information System-Treatment, Storage, and Disposal (RCRIS-TSD) sites within a ½-mile radius;
- USEPA “RCRIS-Large Quantity Generator” (RCRIS-LQG) within a ¼-mile radius;
- USEPA “RCRIS-Small Quantity Generator” (RCRIS-SQG) within a ¼ mile radius;
- USEPA Facility Index System/Facility Registry System (FINDS) for the Subject Property only;
- USEPA Emergency Response Notification System (ERNS) sites within the target property;
- California EnviroStor Database – ENVIROSTOR within a 1-mile radius;
- California Calsites Database – HIST CAL-SITES within a 1-mile radius;
- California Bond Expenditure Plan (BEP) within a 1-mile radius;
- California Waste Management Unit Database System (WMUDS/SWAT) within a ½-mile radius;
- California Cortese within a ½-mile radius;
- California Leaking Underground Storage Tank (LUST) within a ½-mile radius;

- California Facility Inventory Database (CA FID) within a ¼-mile radius;
- California Spills, Leaks, Investigation and Cleanups (SLIC) sites within a ½-mile radius;
- California Underground Storage Tanks (UST) within a ¼-mile radius;
- California Hazardous Substance Storage Container (HIST UST) within a ¼-mile radius;
- California Statewide Environmental Evaluation and Planning System (SWEEPS UST) within a ¼-mile radius;
- California Hazardous Material Incident Report System (CHMIRS) for the Subject Property only;
- California 65 Notification Records within a 1-mile radius;
- California Voluntary Cleanup Program Properties (VCP) within a ½-mile radius;
- California Cleaners within a ¼-mile radius; and
- California Facility and Manifest Data (HAZNET) for the Subject Property only.

The full list of databases compiled, along with definitions for each, is included in Appendix A. The lists record activities associated with hazardous substances, but are not of themselves indicative of contamination or the threat of contamination. Monitoring wells formerly located on the Subject Property at 2580 El Camino Real indicate groundwater flows to the north. Sites located hydraulically cross- or downgradient or in areas separated from the Subject Property by a topographic ridge or river channel (drainage divide) or located downgradient in relation to the Subject Property are evaluated but not necessarily discussed in the report but are included in Appendix A.

3.1 Subject Property Summary

Three addresses on the Subject Property (455 San Antonio Rd., 685 San Antonio Rd. and 2580 El Camino Real) were found as a part of the search of environmental records conducted by EDR. Sears has been located at 455 El Camion Real since the mid-1950s when the property was first developed from vacant land. Sears occupies this location currently but is scheduled to vacate the building by July 2011 as a part of the redevelopment taking place at this time. Quality Tune-Up was located on the south side of the Subject Property at 2580 El Camino Real. The site was initially developed as a fuel storage and distribution retailer (gasoline service station) in the mid-1950s. The service station was converted to a tune-up/oil change and auto repair facility in approximately 1988. The building was demolished and removed in July of 2011.

455 San Antonio Road is shown on RCRA-SQG, FINDS, CA FID UST, HIST UST, SWEEPS CHMIRS, and HAZNET environmental databases. The facility is listed on RCRA_SQG and FINDS because Sears Auto Store (445 San Antonio Road) used and generated small quantities of hazardous wastes, specifically waste oil, antifreeze and hydraulic fluid. It is listed on HAZNET because of the disposal records for hydrocarbons and solvents and CHMRS as a result of a 100 gallon diesel spill onto the parking lot in 28 January 1998. The database

indicates the spill was cleaned up by the Fire Department and wastes were properly disposed (Appendix A).

There were four (4) underground storage tanks registered at the Auto Center and they are listed on the CA FID UST, HIST UST, FINDS and SWEEPS lists. Background environmental reports (Appendix G) indicated that five (5) USTs were removed from the property in 1987. No documentation of violations or releases from the underground storage tanks at the Sears Auto Center was found in the regulatory databases. The facility is not listed on www.geotracker or www.envirostor databases.

Sears vacated the Auto Center earlier this year and removed the remaining eleven (11) underground lifts and associated improvements of environmental concern. We understand Sears is in the process of submitting a closure request to the Santa Clara County Fire Department.

2580 El Camino Real is listed on the LUST, HIST LUST, and HIST CORTESE databases. This fuel service station had a reported release from its underground storage tank system that was initially reported in May of 1986. The UST system was removed in 1988, soil was over excavated, transported and disposed, and groundwater was monitored with agency oversight. The case was closed by the County of Santa Clara with the concurrence of the Regional Water Quality Control Board on 30 September 1996 (Appendix G). Hydraulic lifts were removed from 2580 El Camino Real (Quality Tune Up) in 2010 under a Voluntary Cleanup Program agreement with the County of Santa Clara. The agency issued a letter dated 10 December 2010 indicating that "no further action is required at this time". The building superstructure, foundations and pavements were also demolished and removed from the property in 2010.

685 San Antonio Road was occupied by Rite Aid, who was listed as a RCRA-CESQG. This business generates less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month. No violations were reported associated with this business.

3.2 Surrounding Property Summary

Several sites located within a one-mile radius of the Subject Property are listed in the EDR "Radius Map Report" under one or more of the following databases:

- Local Lists of Registered Storage Tanks
- State and Tribal Equivalent NPL
- State and Tribal Lists of Registered Storage Tanks
- State and Tribal Leaking Storage Tanks
- Local Lists of Hazardous Waste/Contaminated Sites
- State and Tribal Equivalent CERLIS
- Local Lists of Landfill/Solid Waste Disposal Sites
- Federal RCRA Generators List, and

- Other Ascertainable Records

A Summary Table displaying the results of the list review for businesses in the vicinity of the Subject Property is shown below and details are included in Appendix A. The summary table lists database name, number of sites on that database, their distance from the Subject Property, their location in relation to topographic elevation measured on the Subject Property and the businesses' current regulatory status.

Summary Table: Environmental Regulatory Database Review

Environmental Database	Number Listed Sites	Distance from Subject Property	Elevation Relative to Subject Property	Regulatory Status <i>*(topographically higher sites which potentially pose the greatest REC risks are shown in red)</i>
RCRA-LQG	1	1- sites 0- $\frac{1}{8}$ mile	1-equal	1-Registration
RCRA SQG	9	1- site 0- $\frac{1}{8}$ mile 8-sites $\frac{1}{8}$ - $\frac{1}{4}$ mile	1-equal 5-higher 3-lower	1-Registration 5-Registrations 3-Registrations

Due to incomplete address information, 19 orphan sites in the vicinity were not detailed in the EDR Radius Map Report. The lists reported suggested general site locations and normally associated reasons behind these sites becoming listed. Review of the site specific supplemental data available associated with each of the orphan sites did not reveal information indicating the potential impairment of the Subject Property (Appendix A). Review of groundwater chemical analytical data from the Subject Property does not indicate impacts from any of the 19 orphan sites.

Limited information concerning regulatory status, location and distance from the Subject Property, geologic conditions, groundwater hydraulic gradient, contaminants of concern, vicinity supply wells, and interviews with knowledgeable parties were considered for each business listed on the regulatory databases provided by EDR. No RECS for the Subject Property were identified in TOR's review of the EDR Radius Map Report for the surrounding area.

Section 4: Historical Use

4.1 Historical Aerial Photographic Review

Historical aerial photographs of the Subject Property and surrounding area were obtained from EDR. Photographs from 1939, 1948, 1956, 1965, 1982, 1994, 1998 and 2005 were provided to and reviewed by TOR (Appendix B). A narrative description of historical aerial photography is provided below:

- In 1939, the surrounding properties to the north, northwest, and east are mostly agricultural land. Properties to the southwest and south show the beginning signs of development. The Subject Property is mostly agricultural land. There appear to be four dwellings on the property. El Camino Real, San Antonio Road, and Showers Drive are present.
- The 1948 photograph appears similar to the 1939 photograph. Properties to the west and south show an increase in development. The Subject Property does not appear to have changed from the 1939 photograph.
- Development has progressed to the west and south of the Subject Property in 1956. Property to the northeast is still agricultural land. Parcels to the north and southeast have begun development. Several large buildings are present to the southeast. The Subject Property has been graded and development has begun. The Quality Tune Up and Co-op Buildings appear to be present.
- In 1965, surrounding properties to the north, west, south and southeast are developed. Property to the northeast has been graded for construction. The Sears retail building and part of the Sears Auto Center are visible. California Avenue, San Antonio Road and Showers Drive have all been expanded.
- Development of the properties to the northeast has progressed and more buildings are visible to the east in the 1982 photograph. No significant changes are apparent to the north, west, and south of the property. The Sears Auto Center building is complete. No significant changes are apparent to the rest of the Subject Property.
- The 1994 photograph shows no significant changes to the surrounding properties and Subject Property are apparent since the 1982 photograph.
- The buildings adjacent to the Subject Property to the east, but on the same block, have undergone major renovation in the 1998 photograph. Previously seen buildings are replaced by new building. The Subject Property does not appear to have changed since the 1994 photograph.
- The 2005 photograph shows that surrounding properties as well as the Subject Property do not appear to have altered since the 1998 photograph.

4.2 Sanborn Fire Insurance Maps

The Sanborn Fire Insurance Maps consist of a uniform series of large-scale detailed maps, dating from 1867 through 1969 depicting the commercial, industrial, and residential sections of cities. A search of the Sanborn Fire Insurance Maps was conducted for the Subject Property and they were not available. Verification of this is included in Appendix C.

4.3 City Directories

City directories have been published for many cities and towns across the United States since the 18th century. For each address within an area, city directories list the name of each resident or, if a business operates from that address, the name and type of business. While the geographic coverage of city directories is comprehensive for most major cities, many rural areas and small towns may not be included. In addition, many towns and cities have discontinued the practice of issuing city directories. Limited city directory coverage was available from EDR for the Subject Property and surrounding area.

City directory coverage spanned from 1922 to 2006 at approximately five year intervals. Just seven (7) years were provided with listing information: 1957, 1968, 1975, 1982, 1986, 1991, and 2001. As explained in Section 6.1, the reference point for which the City directory coverage was based is located at the northern corner of the Sears Retail Building. Information for this report was compiled with information gathered by geocoding the latitude and longitude of properties identified and by gathering information about properties within 660 feet of target property. Due to the location of the reference point, the southern half of the Subject Property and surrounding properties to the south, southwest, and east were not covered in the review.

A summary of the information provided in the city directory report is presented below and a copy of the report is included in Appendix C: Historical Research.

No listing is provided in 1957. Addresses covered are downgradient of the Subject Property, which are not considered a concern.

Sears Roebuck & Co was the only listing found in the 1968 city directory. Addresses covered are down- and cross-gradient of the Subject Property, which are not considered a concern.

Addresses covered in the 1975 directory are down- and cross-gradient of the Subject Property, which are not considered a concern. No listings are provided.

The following listings were provided in 1986 for the Subject Property address: Allstate Savings and Loan Association, George Contos, Cupertino, and Dean Witter Reynolds financial companies. Although Sears Roebuck and Co is not listed, review of other information and contact interviews for building activities during this time period confirm that Sears was still operational at this address. Addresses covered are down- and cross-gradient of the Subject Property, which are not considered a concern.

The 1991 directory showed Sears Roebuck and Co/Catalog Shipping to be the only listing. Addresses covered are down- and cross-gradient of the Subject Property, which are not considered a concern.

In 2001, no listing was provided.

4.4 Topographic Maps

Historic topographic maps of the Subject Property and surrounding area were obtained from EDR. Maps from 1899, 1902, 1943, 1947, 1948, 1953, 1961, 1968, 1973, 1981, 1991, and 1997 were evaluated by TOR. A review of the topographic maps is provided below. The topographic maps are included in Appendix C.

- The Subject Property is vacant land in 1899. Adobe Creek is also called San Antonio Creek. San Antonio Road and El Camino Real are present. The surrounding properties are undeveloped.
- In 1943, the San Antonio Creek is now called Adobe Creek. Several structures are located on the Subject Property and the number of nearby streets has increased. Buildings are present on the surrounding properties, and Showers Drive is in place.
- No significant changes from the 1943 topographic map to the Subject Property are visible on the 1948 topographic map. Showers Drive has been extended to the north with no major changes noted to the surrounding properties.
- Only one building in the southwest corner of the Subject Property is evident in 1953. A “pipeline” (Hetch Hetchy water main) traverses the northern portion of the Subject Property in an east-west direction. New buildings are developed north and southeast of the Subject Property in the same block. Showers Drive has been disconnected. Agricultural land is indicated to the southeast of the Subject Property.
- The Sears retail store, part of the Sears Auto Center and the Co-op building are visible on the Subject Property in 1961. The Quality Tune Up building is not shown. The pipeline noted in the 1953 topographic map is now called an aqueduct and it traverses the Subject Property on the northern side of the Sears retail store. California Street is in place. Showers Drive connects El Camino Real to California Street. New buildings are present north of the Subject Property. The amount of agricultural land to the east has decreased. Two buildings that were seen southeast of the Subject Property in the 1953 topographic map no longer exist. Several buildings visible in previous topographic maps along streets to the west and south of the Subject Property are not shown on this topographic map.
- The Quality Tune Up building and a smaller structure north of the Sears Auto Center building are present on the 1973 topographic map. Changes to buildings on the same block as the Subject Property are apparent to the north, northeast, east, and southeast. No apparent changes to the properties to the west and south are noted.
- No significant changes on the 1991 map are evident to the Subject Property when compared to the 1973 topographic map. Modifications to buildings in the same block as the Subject Property are apparent to the north, northeast, east, and southeast. No significant changes to the surrounding properties to the west and south are noted.
- The 1997 topographic map depicts no significant changes to the Subject Property from the 1991 topographic map. No major alterations were evident to the surrounding properties as well.

4.5 Environmental Liens or Activity and Use Limitations

An environmental lien search was conducted for 455 San Antonio Road and no environmental liens or Activity and Usage Limitations (AULs) were reported by EDR (Appendix F). In addition, no environmental liens on the APN associated with the Subject Property were reported by the User.

Section 5: User Provided Information

5.1 Proposed Use

This Phase I ESA was requested as part of a financial transaction between MGP and Wells Fargo.

5.2 User Provided Documents

As part of the Phase I ESA, TOR reviews relevant documentation, specialized knowledge, and/or commonly known information available from Glaser Weil and MGP pertaining to the Subject Property. User provided information can be found in Appendix G.

Glaser Weil provided the following documents to TOR for review:

- *Soil and Groundwater Assessment, San Antonio Center, 455 San Antonio Road, 17 March 2011.*
- *Voluntary Cleanup Program, Quality Tune Up #1, 2580 W. El Camino Real, Mountain View, CA, 20 December 2010.*
- *Report for Asbestos Containing Materials (ACM) Located at Sears Store #1238, 455 San Antonio Road, Mountain View, CA 94040, 26 November 2010.*
- *Report for Asbestos Containing Materials (ACM) Located at Sears Auto Center, 455 San Antonio Road, Mountain View, CA 94040, 26 November 2010.*
- *Report for Asbestos Containing Materials (ACM) Located at Rite Aid, Burger King, Party City, Sports Authority, 685 San Antonio, Mountain View, CA 94040, 26 November 2010*
- *Phase I Environmental Site Assessment Report, San Antonio Center, 455 San Antonio Rd, Mountain View, CA 94940, 4 April 2009.*
- *Draft Closure Plan, Sears Facility at 455 San Antonio Road, Mountain View, California, 8 February 2007.*
- *Limited Phase II Site Investigation of Sears Auto Center of Sears Auto Center, 455 San Antonio Road, Mountain View, California, 21 January 2005.*
- *Phase I Environmental Site Assessment for 2580 El Camino Real, Mountain View, California, 17 December 2004.*
- *Phase I Environmental Site Assessment for 455 San Antonio Road, Mountain View, California, 17 December 2004.*

The listed documents contain background information pertaining to the history of the property, regulatory agency involvement and closure activities, current site conditions, improvements, and building materials that have the potential to cause soil and groundwater impacts or require

special handling, storage, and disposal to protect human health and the environment. We understand the engineers, construction managers and contractors involved with the project have considered this information and permitted their activities through the appropriate regulatory agencies.

Section 6: Agency Records Review

TOR used the following agency sources to obtain information on the Subject Property and surrounding area:

- **Department of Oil, Gas & Geothermal Resources (DOGGR):** According to Version 2.0 of the Online Mapping System (DOMS), no oil and gas wells are located within a one-mile radius of the Subject Property.
- **California Department of Water Resources:** geologic information.
- **State Water Resource Control Board (SWRCB):** hydrogeologic information.
- **State Water Resources Control Board (SWRCB) Geotracker Database:** The Subject Property (2580 El Camino Real) was listed as a “Closed” site on this database. The former service station at 2580 El Camino Real was demolished and removed in 2010 after closure of the leaking underground storage tank case in 1996 and closure for the removal on the underground lifts at the location in 2010.

Additional details surrounding the former Leaking Underground Storage Tank Site are provided in Sections 2.2, 3.1, 3.2 and in the Appendices of this report.

- **Department of Toxic Substance Control (DTSC) ENVIROSTOR Database:** The Subject Property and surrounding area were not shown on this website; however, 5 sites with a “State Response” designation are present to the east northeast of the Subject Property. These cases also appeared on the environmental database lists and are considered in Section 3.1 of this report. Those listings and their relationship to the Subject Property are shown on the Summary Table in Section 2.3 of this report. The potential for these sites to have caused groundwater contamination at the Subject Property is low.

Section 7: Interviews and Subject Property Reconnaissance

7.1 Interview

Mr. Barron Caronite, Director of Land Development, Merlone Geier Management, LLC completed the Interview Form on 30 June 2011 regarding his knowledge of the history and operations performed at the Subject Property. The Interview Form is appended to this report as Appendix H. According to Mr. Caronite, no hazardous substances are currently stored, used, and/or generated at the Subject Property. Mr. Caronite is unaware of any past operations at the Subject Property or immediate surrounding area that could impact soil or groundwater media beneath the Subject Property.

7.2 Subject Property Reconnaissance-Visual and Physical Observations

Edwin Schramm of TOR performed the Subject Property reconnaissance on 5 July 2011. Visual observations noted during the ground reconnaissance are included in the table below. Photographs of Subject Property are included in Appendix I.

Subject Property Reconnaissance Summary Table

Feature / Characteristic	Y/N	Comments
Current Use of Subject Property	NA	Commercial Retail Shopping Center
Vacant Spaces / Undeveloped Areas / Wetlands	Y	
Landscaping (<i>potential pesticide use</i>)	N	Asphalt paved-
Parking Lots / Structures (<i>potential for vapor intrusion or chem. Spills</i>)	Y	Vapor Intrusion chem. spill potential low
Previous Uses or Investigations		
Concrete pads (<i>associated with electrical systems or large machinery</i>)	Y	Transformers, natural gas engine, electrical installations (Appendix I)
Former Pump Islands	N	Quality Tune Up and Sears Auto facilities removed
Fill Ports (<i>small manholes associated with USTs</i>)	N	Quality Tune Up and Sears Auto facilities removed
Vent Pipes (<i>associated with USTs</i>)	N	Quality Tune Up and Sears Auto Facilities removed
Former Building Foundations	N	Quality Tune Up foundation removed. Sears pending removal of building and associated facilities
Drums and Containers	N	None observed
Sumps	Y	Sears Auto Center-pending removal under closure plan
Clarifiers	N	
Hoists or Lifts (<i>often associated with hydraulic fluids & auto repair</i>)	N	Quality Tune Up and Sears Auto removed lifts in 2010
Concrete / Asphalt patches	N	
Monitor/Supply/Disposal Wells	N	None observed

Subject Property Reconnaissance Summary Table

Feature / Characteristic	Y/N	Comments
Containers / Containment		
Aboveground Storage Tanks (ASTs)	N	Removed
Underground Storage Tanks (USTs)	N	Removed from Quality Tune Up and Sears Auto
Hazardous Chemicals (<i>Storage, Use, Disposal</i>)	N	
Petroleum Hydrocarbons	N	Ceased activity 2010-2011
Pesticide Usage or Storage	N	None observed
Unlabeled Containers/Substances	N	None observed
Solid Waste Storage (<i>i.e. bins</i>)	Y	Demo in progress
Septic Tanks	N	
Berms (<i>potential secondary containment</i>)	N	
Potential Waste Disposal Systems / Containment		
Waste Water Generation	N	
Pits, Ponds, Lagoons	N	
Pools Of Liquid	N	
Floor Drains	Y	Connected to sewer
Drainage Systems (<i>i.e. ditches</i>)	N	
Dumping or Filling Activities (<i>i.e. soil or debris piles</i>)	N	None observed
Roads And Trails With No Apparent Purpose (<i>potential for illicit dumping</i>)	N	
Potential Evidence for Chemical Impacts		
Materials Spills	N	
Unusually Stained or Corroded Pavement or Flooring	N	
Odors	N	
Air Emissions	N	
Interior water damage / mold (<i>potential pathway for impacts</i>)	N	Not observed
Stained Or Disturbed Soil	N	
Stressed Vegetation	N	
Non ASTM items & Miscellaneous		
Electrical Transformers (PCBs)	Y	Some transformer content is unknown, no labeling
Florescent Lighting (PCBs)	Y	PCB content unknown
Suspect Asbestos-Building Materials	Y	ACM identified all 4 buildings (Appendix G)
Water damage / Mold	N	Not observed
Suspect Lead-Based Paint	Y	Not tested
Fiber Optics Lines	N	Not observed

Subject Property Reconnaissance Summary Table

Feature / Characteristic	Y/N	Comments
Heating Systems (associated with heating oil, gas, electric or steam radiators)	Y	Main Sears Retail Building
High Voltage Power Lines/ Magnetic Fields	N	Not conducted/Not observed
Cellular Phone Tower	N	Not conducted/Not observed
Neighboring Dry Cleaners	Y	No active Assessment or Remediation on-going, No violations reported-cleaners on west and south perimeters
Neighboring Property USTs	N	Valero Gas Station
Any sites NOT listed in EDR? Incorrect addresses?	N	

Section 8: Historical Materials of Concern

8.1 Suspect Asbestos-Containing Materials

While the use of asbestos in the manufacture of most building materials has not been fully prohibited by law, the use of asbestos, for the most part, has voluntarily been discontinued since the late 1970s. Some non-friable materials, such as roofing material and floor coverings (floor tile and mastic) may have been manufactured with asbestos materials and may have been used into the early 1980s. Given the Subject Property was initially developed in approximately 1958, asbestos materials should be anticipated and ACM reports have been prepared for all four (4) buildings on the Subject Property. We understand the removal action for asbestos is being performed under regulatory oversight and appropriate documentation for the work will be prepared.

8.2 Lead-based Paint

In 1978, the Consumer Products Safety Commission banned paint and other surface coating materials containing lead. Because the property was first developed in 1958, these materials may be present and we understand will be properly handled and removed as a part of the demolition of the current structures on the Subject Property.

8.3 PCB Equipment

Polychlorinated biphenyls (PCBs) were historically used as coolants and lubricants in transformers, capacitors, and other electrical equipment beginning in 1929 because they do not burn easily and serve as a good insulating material. Several transformers were observed on the Subject Property during the Subject Property site visit. These transformers appeared in good repair and no perimeter oil staining was noted at the time of the site visit. The transformers were not all clearly marked and may contain PCBs. These privately owned transformers should be properly handled and disposed during the demolition of the property.

Fluorescent light fixtures were observed in the ceilings of most of the buildings as well as around the lighted parking lot areas. PCBs are known to be present in fluorescent light ballasts and electric transformers; although, there were no documented or observed releases of PCBs on the Subject Property at the time of the site visit. Proper handling and disposal procedures are required when handling these materials.

8.4 Radon

The Federal Environmental Protection Agency put Santa Clara County in Radon Zone 2 (indoor air average level of < 2 pCi/L). Three federal tests of radon in 1st floor living areas revealed an average concentration of 0.600 pCi/L. This information is not specific to the Subject Property and site specific testing would be required to evaluate any risk from radon.

8.5 Mold

TOR did not (i) perform a mold/fungi inspection, (ii) perform any building material surface mold sampling, or (iii) perform air sampling for mold spores at the Subject Property as part of this Phase I ESA. The property is developed and includes air conditioner and refrigeration facilities

that are sometime responsible for mold development. Any demolition activities involving the structures should include inspections for mold development prior to initiation. Employee complaints or observations in this regard should also be investigated and appropriately mitigated for the protection of human health.

Section 9: Conclusions and Recommendations

TOR conducted the Phase I ESA in conformance with the scope and limitations of ASTM 1527-05 for the San Antonio Center property located at 455, 635-685 San Antonio Road in Mountain View, California. Any exceptions or deletions from this practice are detailed in Section 10 of this report.

9.1 Conclusions

The San Antonio Center was constructed in the late 1950's on agricultural property comprising approximately 16.34 acres. The Subject Property includes four (4) commercial retail structures totaling approximately 230,000 square feet of floor space. These improvements were actively being demolished during the implementation of this environmental site assessment.

The Sears Auto Center and Quality Tune Up facilities represent historic RECs; however, environmental assessment and remediation performed over the past two (2) decades and subsequent regulatory involvement and approval of the work has mitigated the RECs associated with the Subject Property. Groundwater sampling and chemical analysis around the perimeter of the 455 San Antonio Road building suggests that both onsite and offsite releases of hazardous waste have not impacted groundwater at the locations tested. No businesses in the vicinity were identified on regulatory agency databases or during the site visit as having the potential to cause soil or groundwater contamination beneath the Subject Property.

9.2 Recommendations

Based on the conclusions provided above, TOR does not recommend further environmental evaluation for the Subject Property at this time. TOR recommends the property owner continue to monitor Sears' activities until the company vacates the property and that all submittals to environmental regulatory agencies are collected for the Subject Property's historical record. Further, the owner should verify and document that regulatory closures for the redevelopment are issued by the appropriate agencies.

Section 10: Deviations

No deviations from the ASTM 1527-05 standard were made during the preparation of the Phase I ESA portion of this report. Data gaps in Subject Property's history that might result in soil or groundwater contamination were not identified during the implementation of the scope of work.

Mr. Kenneth Davis
Dba Quality Tune Up
5509 Sunset Hills Court
San Jose, California 95138

Subject: Voluntary Cleanup Program, Quality Tune Up #1, 2580 West El Camino Real,
Mountain View, CA

Dear Mr. Davis:

The County of Santa Clara Department of Environmental Health (DEH) has reviewed the Results of Soil Sampling – Hydraulic Lift Removal Report prepared by your consultant Ground Zero Analysis, Inc. (GZA) and dated August 5, 2010. All aboveground structures have been removed from the site.

Based on our review, five soil samples were collected from 8-8.5 feet below the ground surface (ft bgs) following removal of 5 hydraulic lifts. The samples were analyzed for Total Petroleum Hydrocarbons as Hydraulic Oil (TPHho), Oil and Grease (O&G), Silica Gel Treated O&G, Benzene, Toluene, Ethylbenzene, Xylenes (BTEX) and Polychlorinated Biphenyls (PCBs). BTEX and PCBs were not reported to be present in any of the samples above the laboratory reporting limits. Maximum concentrations were reported of 470 parts per million (ppm) O&G, 150 ppm Silica Gel Treated O&G, and 270 ppm TPHho.

This site is also a closed Fuel Leak Investigation case (06S2W20D01f) and was closed on September 30, 1996. The case closure summary states that groundwater was present between 22-43 ft bgs and flowed to the northwest. At the time of case closure, residual contamination remained in soil of 975 ppm TPH as Gasoline (TPHg), 0.004 ppm Toluene, 0.2 ppm Ethylbenzene, and 0.005 ppm Xylenes; and in groundwater of 2,900 parts per billion (ppb) TPHg, 3.8 ppb Toluene, 35 ppb Ethylbenzene, 120 ppb Xylenes, and 17 ppb Methyl tert Butyl Ether (MtBE).

It is our understanding that the site will be redeveloped commercially and is located in a commercially zoned area. Based on review of the information provided, no further action is

Mr. Davis
December 20, 2010
Page 2 of 2

required at this time. It should be noted that any additional and/or previously unidentified contamination at this site might require further investigation or cleanup.

If you have any questions or need further assistance, please feel free to contact Ms. Lani Lee at (408) 918-1977.

Sincerely,

Michael Balliet

Section 1: Introduction

KEH & Associates, Inc. (KEH) prepared this Soil and Groundwater Assessment report on behalf of Glaser Weil Fink Jacobs Howard Avchen and Shapiro LLP (Glaser Weil) documenting the background, planning, and implementation of a soil and groundwater assessment of the property located at 455 San Antonio Road, Mountain View, California (Figure 1). This project was undertaken at the request of Merlone Geier Partners as a part of the planning process for redevelopment of the property.

The proposed project plan includes the construction of a multi-use residential-commercial building integral with an underground parking structure that will extend approximately 18 feet below the ground surface (bgs). Subsurface investigation of the property suggests subgrade excavations for the building could intercept groundwater beneath the site.

As such soil will be exported and groundwater dewatering activities may be necessary during construction. Assessment of these media for hazardous waste prior to initiating the project is required to plan for their management and disposition. The purpose of this assessment was to sample and analyze soil and groundwater for chemical impacts based on historic land use information assembled as a part of a Phase I Environmental Site Assessment conducted in 2009.

1.1 Background

The San Antonio Center (SAC) is located at 455 San Antonio Road, Mountain View, California (Subject Property) between California Street and El Camino Real. It includes six (6) parcels (Assessor's Parcel Numbers 148-20-001 through 004, 148-22-001 and 002) encompassing approximately 16.34 acres of land.

This property was used for agricultural purposes until the mid-1950's when it was developed as a commercial shopping center, and has remained a commercial shopping center since that time. The Phase I Environmental Site Assessment, San Antonio Center reports 16 leaking underground storage tank sites within ½ mile of the Subject Property and four (4) dry cleaning businesses with ¼ mile of the Subject Property (Kennedy/Jenks, 2009). These businesses have a history of causing soil or groundwater contamination as well as a potential to impact neighboring properties and beyond. Fuel storage and distribution facilities and dry cleaning businesses use hazardous substances that can be detected in soil and groundwater using USEPA Methods 8260B and Method 8015M (USEPA SW846).

The San Antonio Center anchor tenant has been Sears since the property was developed in the mid-1950s. The existing store building is located over the area of the property slated for development of the underground parking garage/residential/retail shopping center. Architectural drawings of the proposed construction indicate the base of foundations for the new building may extend as deep as 18 feet bgs at some locations. Based on historic information, depth to groundwater at this site ranges between 16 to 20 feet bgs, and therefore, excavations for construction may require dewatering, groundwater collection, treatment and permitted disposal.

1.2 Regional Geology

The Santa Clara Valley is geologic structural trough formed within the confines of the San Andreas fault system in the San Francisco Bay area. The valley is bounded on the southwest by the Santa Cruz Mountains and the San Andreas fault and on the northeast by the Diablo Range and the Hayward fault. The Subject Property is underlain by Holocene continental alluvial and bay deposits. Plio-Pleistocene poorly sorted and stratified alluvial gravels, sands, silts and clays of the Santa Clara Formation underlie the Holocene deposits. These geologic formations were formed as a result of the uplift and erosion of the bordering Coast Range. Lithologic similarities make distinction of these two units difficult (DWR 1975). The two geologic formations unconformably overlie non-water bearing folded Tertiary rocks (CDMG, 1966).

Land uplift and subsidence in Santa Clara Valley due to the recharge and withdrawal of groundwater is well documented by several public agencies such as the Santa Clara Valley Water District (SCVWD) and the USGS (Poland and Ireland, 1988). An increase in the withdrawal of water from the Santa Clara Formation aquifer and a decrease in rainfall for the first half of the twentieth century resulted in a substantial drop in well levels and a corresponding land subsidence of approximately 13 feet. Subsidence in the Mountain View area between 1934 and 1967 is shown between 4 and 6 feet. Recovery efforts over the past quarter century, such as the import of water from outside sources and the construction of percolation ponds, have allowed water levels to partially recover in more permeable areas of the aquifer system. Recovery has not occurred where silt and clay soil structures have collapsed. The Subject Property is reported situated greater than 100-150 feet above the northern extent of the confined aquifer system.

1.2.1 Hydrogeologic Information

The unconsolidated Holocene clays silts and sands that underlie the Subject Property are the upper confining layer for the groundwater aquifer estimated to be at approximately 100-150 feet bgs. Artesian springs and flowing wells were common in the area prior to development and extraction as a water supply. Groundwater is unconfined around the valley margins and recharge of the confined aquifer is dependent on infiltration in these areas.

Groundwater information for the Subject Property and surrounding area was provided in an assessment of groundwater relating to a former underground storage tank release from at 2585 El Camino Real on the south side of San Antonio Center (Subject Property). Seven groundwater monitoring wells installed in this area recorded groundwater elevations between approximately 44.47 feet above mean sea level (amsl) and 43.98 feet amsl. Groundwater flowed towards the north (Ground Zero Analysis, 1996). The topography at the Subject Property slopes gently to the north and west and groundwater flow direction appears to mimic surface topography.

Groundwater was encountered in all four subsurface penetrations installed as a part of this assessment. The depth at which groundwater was encountered varied between 15 feet bgs in SAC1 (approximately 49 feet amsl) and over 20 feet bgs (approximately 44 feet amsl) in SAC4. Clay-rich soils temporarily blocked water flow through the borehole wall and as drilling advanced through deeper soils. If and when breakthrough occurred the sampling head was deeper and the occurrence and depth

of the water bearing materials became difficult to identify. Water was pushed along the soil's contact with the acetate sleeve in the core barrel making it difficult to precisely identify the water bearing zone within the soil core. Careful observation of the soil cores through the water zone suggest more permeable sands occur as discontinuous layers within the gravelly silty clay that dominates the upper 25 feet (Appendix A). The elevation of groundwater in this area of the Subject Property is very close to the elevation of groundwater observed at the Quality Tune Up site suggesting a larger perched groundwater layer approximately 44 feet amsl.

Section 2: Soil and Groundwater Assessment

2.1 Scope and Objectives of the Assessment

The purpose of the Soil and Groundwater Assessment was the evaluation of:

- 1) Presence and concentration of total petroleum hydrocarbons (TPH) and volatile organic compounds (VOCs) in subsurface soils at multiple depths in four (4) locations within the footprint of the planned excavation.
- 2) Presence and concentration of TPH and VOCs in groundwater at four (4) locations within the footprint of the planned excavation.

The objective of the investigation was to provide analytical information to guide excavation planning including health & safety, excavation, handling, transportation, permitting, treatment and disposal of generated soil and groundwater as required for the project.

2.2 Implementation, Soil and Groundwater Assessment

On 9 February 2011, KEH & Associates, Inc. set up and conducted direct-push drilling activities over four (4) subsurface exploratory penetration locations selected within the planned footprint of the excavation for the proposed underground parking structure and shown on Figure 2. A push-probe type drill rig provided and operated by Vironex, Inc. was used to drive a 1 3/4-inch diameter macro core sampler at 4-foot intervals continuously coring soil to a depth of 25 feet bgs. All penetration points were hand augered to a depth of 5 feet bgs as an additional precautionary step to avoid damaging underground improvements should they be encountered. Vironex is a licensed driller in the State of California and was retained by KEH based on its qualifications and drilling experience in the area of the Subject Property.

Soil types were logged under the supervision of a State of California Professional Geologist in accordance with the Unified Soil Classification System. A detailed log of drilling activities and observations was compiled at each boring location at the time of the subsurface drilling and sampling activities (Appendix A). After total depth of the penetration was reached, the borehole was backfilled using a hydrated bentonite capped and finished with a pavement patch product.

2.3 Summary of General Field Activities

2.3.1 Utility Clearance

To initiate assessment of underground utilities that might be encountered during subsurface drilling and sampling activities, Underground Services Alert (USA) was contacted and informed of the pending subsurface assessment activities. USA notified all participating companies and agencies concerned about the protection of their underground improvements. Further, areas proposed for drilling were marked at

the property so that concerned parties could evaluate the potential for drilling to damage their facilities. KEH was contacted by each concerned company/public agency and provided with input regarding potential utility/drilling conflicts. KEH contacted the drilling subcontractor and provided the USA ticket numbers so they could independently verify precautionary utility clearances.

KEH retained ULS Services Corporation (ULS), an underground location service, to screen proposed drilling locations to verify and mark out areas of potential underground conflicts using a number of specialized geophysical instruments. Merlone Geier Partners provided KEH with "DEMO" and "AS-BUILT" drawings depicting underground improvements for the rear of the Sears building and ULS at the Subject Property on 18 February 2011 to establish each penetration point and discuss precautionary measures when commencing the work (Appendix B).

2.3.2 Health & Safety

KEH prepared a site specific Health & Safety Plan HASP for the project. The HASP identifies the potential hazards that could be encountered during performance of the proposed subsurface investigation. The HASP is consistent with current Federal Occupational Safety and Health Administration (OSHA) requirements for hazardous waste operations [29 Code of Federal Regulations (CFR) 1910.120 (e)]. All activities were conducted in Level D personal protective equipment (PPE). The HASP and specific tasks for the day was presented to workers in a meeting before initiating fieldwork at the Subject Property.

2.3.3 Equipment Decontamination

Drill rods were decontaminated prior to their advancement during direct push activities. Direct push rods were washed with potable water and a phosphate-free detergent using a brush as necessary. The probes were subsequently rinsed with potable or deionized water and air dried before each use. The direct-push rig was equipped with a containerized wash rack for decontamination activities.

2.3.4 Investigation Derived Waste

Investigation derived waste (IDW) generated from the sampling activities includes soil and equipment decontamination rinsate water. The rinsate water was mixed with soil residuals from the drilling and containerized in a 55-gallon DOT-approved drum. The IDW remains onsite pending a determination of the appropriate method of disposal based on the waste profiles generated from the analytical results. The material is scheduled to be disposed according to the appropriate rules and regulations. Disposal records will be provided to the Client upon receipt.

2.4 Soil and Groundwater Sampling

2.4.1 Locations

KEH selected penetration locations based on our understanding of the location of the proposed underground parking structure for the project. Borings were positioned within the proposed footprint taking in to consideration:

- Daily use and traffic patterns.
- Known underground utility conflicts.
- Proposed location relative to other locations drilled as a part of this investigation.

The four (4) penetration points were identified as SAC1 through SAC4 (Figure 2). SAC 1, SAC2 and SAC-3 were positioned on the west side of the Sears Building in the parking lot area between the building and San Antonio Road. SAC4 was positioned behind the Sears building on its southeast corner. All locations were positioned well away from concrete pavements within the asphalted parking area (Figure 2). The penetration locations were spread across the area based on the space accessible for drilling and our understanding of the proposed project.

USA and geophysical screening indicated potential underground utilities at several locations in the vicinity of our proposed penetration points. Care was taken to avoid these underground improvements and including the corridor traversed by the Hetch Hetchy Reservoir water conveyance pipeline to the north of the Sears building. ULS identified several underground anomalies that were successfully avoided during the drilling activities.

2.4.2 Sampling Methods and Activities

Four (4) soil samples were collected at depths between 6 and 20 feet bgs from each of the 4 borings drilled. Soil cores were extracted from the macro core sampler and organized by depth on the ground surface for logging purposes. Acetate core liners were splayed with a custom cutting tool and soils within were screened with a Photoionization Detector (PID). Soils were sampled using United States Environmental Protection Agency (USEPA) SW-846, Method 5035 protocol with a "Lock N' Load™" handle and soil syringe system to collect undisturbed measured soil cores for VOC analysis. Acetate sleeves were cut at selected intervals, fitted with Teflon lined end caps and labeled for total petroleum hydrocarbon analysis. Soil samples were labeled with the time, date, and sample number prior to being placed in a cooler packed with water ice.

A new 5-foot long, ¾-inch diameter PVC well screen was attached to 5 new ¾-inch PVC risers and lowered into the newly drilled hole. Teflon tubing was inserted down the riser pipe to the bottom of the well-screen and gently manipulated with an up and down motion pumping water to the surface evenly and slowly, minimizing turbulence. Sampling containers provided by the analytical laboratory were completely filled (no headspace), capped, and labeled prior to being placed in a cooler packed with water ice.

Analytical services were performed by Test America Laboratories, Inc. (Test America), a California Department of Health Services (DHS)-certified analytical laboratory. Test America provided soil and groundwater sample containers, coolers and labels as well as analytical services for the project. Test America's analytical laboratory report for the project is discussed below and included in Appendix C.

Section 3: Analytical Testing Results

Soil and groundwater samples were collected in the area proposed for the construction of a new mixed use complex with an underground parking garage. It is anticipated the proposed excavation will extend to a depth of up to 18 feet in localized areas. Analytical testing for identified chemicals of potential concern (COPC) was conducted on 16 soil samples and 4 groundwater samples to characterize the nature of impacts to soil slated for off-site disposition.

3.1 Soil

The analytical results from the soil sampling and testing task are shown on Table 1. A summary of soil detections is presented as follows:

Soil Testing Detection Summary

COPC (mg/Kg)	SAC1-7	SAC1-11	SAC 2-8	SAC4-15	SAC4-18
TPH DRO (C10-C28)	5	25	6.2	2.5	17
TPH MRO (C24-C36)	ND	110	ND	ND	57

The distribution of sampling points and the associated analytical results are shown on Figure 3. The highest concentrations of TPH diesel range organics (DRO), (C10-C28) were found in SAC1 at 11 feet bgs at a concentration of 25 mg/kg. A similar concentration of TPH diesel range organics were found at 18 feet bgs in SAC4-18 (17 mg/Kg). TPH motor oil range organics (MRO) (C24-C36) were also detected in SAC1 and SAC4 at depths of 11 and 18 feet respectively. SAC1-11 had TPH MRO range concentrations of 110 mg/kg while SAC4-18 revealed concentrations of 57 mg/kg. Detected concentrations of TPH were all under San Francisco Regional Water Quality Control Board's (SFRWQCB) Environmental Screening Levels (ESLs) for TPH and related compounds (CRWQCB, 2007). VOCs related to the TPH or any other source were not detected in the 16 soil samples analyzed.

3.2 Groundwater

The analytical results of the groundwater sampling and analysis task are shown in Table 2. A summary of detections in groundwater is presented as follows:

Groundwater Testing Detection Summary

COPC (ug/L)	SAC1	SAC2	SAC3	SAC4
Toluene	1.2	0.61	0.52	0.84
Total Xylenes	1.3	ND	ND	1.9

Toluene and total xylenes, VOCs most often associated with gasoline, were detected in groundwater samples. Toluene was detected at trace concentrations ranging between 0.52 and 1.2 ug/L at each of the four (4) locations sampled. Total xylenes were detected at SAC1 and SAC4 (Figure 4) at trace concentrations between 1.3 and 1.9 ug/L. VOCs in groundwater beneath the area evaluated as a part of this assessment were limited to toluene and total xylenes. Both VOCs were detected at concentrations well below their respective Maximum Contaminant Levels (MCLs). The MCL for toluene as regulated in the State of California is 150 ug/L and the MCL for total xylenes is 1,750 ug/L.

Section 4: Conclusions and Recommendations

4.1 Conclusions

The purpose of this environmental assessment was to characterize the type and concentration of potentially hazardous chemicals that may have impacted soil and groundwater within the footprint of a proposed mixed-use development that will include an underground parking garage. The encounter of impacted soil or groundwater during construction would require specific soil management, transport and disposal procedures be implemented as a part of the project.

Review of historical information collected as a part of a Phase I Environmental Site Assessment (ESA) prepared in 2009 in accordance with ASTM 1527-05 indicates the highest potential for impacts to soil and groundwater by hazardous wastes would be associated with surrounding commercial businesses. Businesses identified in the area with the highest potential to impact soil and/or groundwater at the Subject Property included fuel storage and distribution stations, vehicle maintenance facilities, and dry cleaning operations.

Laboratory analyses of 16 soil samples collected between approximately 6 and 20 feet bgs within the proposed excavation footprint were completed. Soil samples were analyzed for TPH by USEPA Method 8015B and VOCs by USEPA Method 8260B based on the chemicals of potential concern associated with the businesses screened during the Phase I ESA.

Soil testing results revealed maximum concentrations of TPH DRO (C10-C28) at 25 mg/kg and TPH MRO (C24-C36) at 110 mg/kg. These concentrations are below the SFRWQCB ESLs for TPH and related compounds. VOCs including TPH gasoline range organics (C5-C12) were not detected in the 16 soil samples collected as a part of the assessment of the Subject Property.

Laboratory analyses of groundwater samples collected from four (4) temporary wells during the assessment activities were completed. Groundwater samples were tested for concentrations of TPH by USEPA Method 8015B and VOCs by USEPA Method 8260B. Analytical testing revealed trace maximum concentrations of toluene and total xylenes of 1.2 ug/kg and 1.9 ug/kg respectively. These values are below MCLs as regulated in the State of California.

4.2 Recommendations

Based on the findings of this assessment of potential soil and groundwater impacts within the area planned for excavation, KEH does not recommend additional environmental testing at this time. KEH recommends this report be provided to selected qualified contractors for review during their project planning process.

Groundwater will be encountered during the excavation process below an approximate depth of 15 feet. The high moisture content of in-place soils may affect excavation processes and any required pumping and discharge of groundwater should occur in accordance with the discharge requirements specified by a site specific NPDES permit.

Section 5: Limitations

This report has been prepared for the exclusive use of Glaser Weil Fink Jacobs Howard Avchen and Shapiro LLP (Glaser Weil) and its authorized entities and agents. Any other use of this document, or any of its contents, would constitute unauthorized use. KEH & Associates, Inc. (KEH) is not responsible for misinterpretation of this report, or any of its contents or direct, incidental, indirect, or consequential damages (including loss of profits) incurred by the client or by any third party occasioned by services performed by KEH, or by the application or use of this report by the client or others.

The results contained in this report are based upon the information acquired during the various assessments and investigations. It is possible that variations at the property could exist beyond or between points explored during the course of the various investigations. Also, changes in conditions found could occur at some time in the future due to possible contaminant migration, variations in rainfall, temperature, and/or other factors not apparent at the time of field activities. Undocumented, unauthorized releases of hazardous materials, the remains of which are not readily identifiable by visual inspection and are of different chemical constituents, are difficult and often impossible to detect within the scope of a chemical specific investigation. KEH does not assume responsibility for the discovery and elimination of hazards that could possibly cause accidents, injuries, or damage unless those hazards were apparent, and should have been discovered, as a result of the services KEH performed for the Client. This document is based in part on information collected, compiled, or otherwise provided by entities other than KEH. KEH therefore makes no representation as to the adequacy or professionalism of those analysts, or to the thoroughness or validity of agency-generated information. Changes in regulatory policy and/or requirements and technological advances that post-date this report obviously are beyond the scope of this investigation and report.

GENERAL LIMITATIONS			
<p>NOTE: The work described herein is performed to industry standards (or higher) using multiple methodology and QA/QC protocol. ULS cannot guarantee the accuracy or the ability to detect all underground facilities and potential interferences. Non-conductive or conductive utilities/facilities may not be detected due to variables and constraints beyond ULS control. Where known, constraints and limitations will be brought to the client's attention. Excavation work may result in injury to persons and/or damage to facilities. Client and/or excavator are advised to take all steps necessary to avoid contact with underground facilities. This includes, but is not limited to, safe digging practices, hand tooling in congested areas and within two feet on side of marked utilities (distance may vary by law), utility drawing review, site facilities representative review, and "one-call" utilities notification. ULS and its representatives are not responsible for injury to persons or damage to facilities. This document and accompanying pages will be delivered to the client before commencement of intrusive work for the client's review. If any questions arise, please notify our office immediately.</p> <p>NOTE: Specific comments/limitations/constraints, known and recognized will be recorded on attached pages (field notes). Caution – some facilities (conductive or non- conductive) may not be detected. Not all limitations and constraints may be recognized.</p>

METHODS AND GENERAL OBSERVATIONS:

METHODS:

ARRIVED SITE AND COMPLETED H&S TAILGATE. SET UP DELINEATORS AROUND VEHICLE AND NEAR BLINDSPOTS AND ENTRY WAYS. MADE GENERAL SITE WALK TO REVIEW SURVEY AREAS (PROPOSED ZONES). CHECKED FOR SURFACE UTILITY MANIFESTATIONS SUCH AS VALVES, METERS, CONDUITS, TRENCHING SEAMS, VAULT LIDS AND EXISTING ONE CALL MARKINGS. BEGAN MARKOUT WORK.

METHODS UTILIZED INCLUDE: EM PIPE AND CABLE LOCATOR USING AMBIENT, GROUND INDUCTION AND CONNECTION MODE SWEEPS. EM INDUCTION METAL DETECTOR AND GPR. A CARTISIAN GRID PATH IS WALKED AT EACH PROPOSED ZONE USING ALL METHODOLOGY. OBSERVATIONS ARE MARKED WITH WHITE AND/OR PINK PAINT. ZONE IS MARKED OUT WITH WHITE AND/OR PINK MARKINGS (REFER TO PHOTOS).

SITE CALIBRATION - GENERAL OBSERVATIONS

EM PIPE AND CABLE TRANSMITTER TO RECIEVER (GROUND INDUCTION AND CONNECTION) BROADCASTING IS ___GOOD___ ATTENUATION EFFECTS FROM CONCRETE STEEL REINFORCEMENT ___NIL___
 EMIMD METAL DETECTOR BACKGROUND EM NOISE IS ___LOW___
 GPR PENETRATION AND RESOLUTION IS ___1 TO 2 FT AND POOR___.

CLIENT KEH
LOCATION 455 SAN ANTONIO RD
DATE 2-4-11

SPECIFIC OBSERVATIONS AND COMMENTS OR CONCERNS:

Five locations pre-marked in the field by KEH our designated as ULS#1 through ULS#5.

ULS 1 One unknown signal was found trending east into the survey zone and turning north continuing out of the survey zone. No other signals were found impacting the survey zone.

ULS 2 No signals were found within the survey zone limits however a signal was found trending east-west directly south of the curb in the rocks planter.

ULS 3 One unknown signal was found trending east to the survey zone and turning north before entering the survey zone.

Some caution is advised in the area of these three points for possible PVC water lines associated with irrigation. No signals were found and GPR results were poor.

ULS 4 No signals were found in conflict at this location however some caution is advised for storm drain lines referenced above. Direct connection to the natural gas tracer wire located at the meters north east in the walkway showed a signal trending east away from the survey zone. Direct connection to water lines showed mixed results with a signal found trending west through the pickup area and remaining outside the survey zones. Some caution is advised in these areas for possible PVC water lines.

ULS 5 Point is located in the pickup and delivery area east of the building. Main electric and telephone lines remain south and away from the survey zone. There is a visible trench patching and or saw cuts for trench patching trending north to south through the east edge of the survey zone. No signal was found consistent with this patching. One unknown signal was found trending north south between buildings and on the east side of the survey zone. The storm drain inlet north east of the survey zone shows a visual trend north east to the storm drain manhole. Visual observation at the manhole showed piping consistent with the trend from the storm drain inlet. Additionally three other pipes are observed trending north, west and southwest from the manhole at a depth of approximately two feet. GPR transects around the manhole showed no parabolic response and are consistent with poor results throughout the area.

END REPORT / REFER TO PHOTOS.

LOCATE ENERGY ISOLATION INCLUDING WATER AT THIS SITE AND SAWCUT, JACKHAMMER, AIRKNIFE DIG CAREFULLY IN EACH LOCATION.

Comments

No additional comments.

Receipt

1/ COC says diesel w/ silica gel but per client request not logged for silica gel cleanup.
2/ Sample SAC2-18 has sampling time as 10:00 on COC but 10:15 on container. Logged in as on COC.

All other samples were received in good condition within temperature requirements.

GC/MS VOA

Method(s) 8260B: The internal standard of 1,4-Dichlorobenzene-d4 was low for sample SAC3-8.5 and only one vial was provided by client.

No other analytical or quality issues were noted.

GC Semi VOA

Method(s) 8015B: Concentrations reported represent individual or discrete peaks: SAC3-18.

No other analytical or quality issues were noted.

Metals

No analytical or quality issues were noted.

Organic Prep

No analytical or quality issues were noted.

Question	T / F / NA	Comment
Radioactivity either was not measured or, if measured, is at or below background	N/A	
The cooler's custody seal, if present, is intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	False	see ncm
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
If necessary, staff have been informed of any short hold time or quick TAT needs	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True

Detection Summary

Client: KEH & Associates, Inc.
Project/Site: San Antonio Center

TestAmerica Job ID: 720-33295-1

Client Sample ID: SAC1

Lab Sample ID: 720-33295-1

Analyte	Result	Qualifier	RL	MDL	Unit	Dil Fac	D	Method	Prep Type
Toluene	1.2		0.50		ug/L	1		8260B	Total/NA
Xylenes, Total	1.3		1.0		ug/L	1		8260B	Total/NA

Client Sample ID: SAC2

Lab Sample ID: 720-33295-2

Analyte	Result	Qualifier	RL	MDL	Unit	Dil Fac	D	Method	Prep Type
Toluene	0.61		0.50		ug/L	1		8260B	Total/NA

Client Sample ID: SAC3

Lab Sample ID: 720-33295-3

Analyte	Result	Qualifier	RL	MDL	Unit	Dil Fac	D	Method	Prep Type
Toluene	0.52		0.50		ug/L	1		8260B	Total/NA

Client Sample ID: SAC4

Lab Sample ID: 720-33295-4

Analyte	Result	Qualifier	RL	MDL	Unit	Dil Fac	D	Method	Prep Type
Toluene	0.84		0.50		ug/L	1		8260B	Total/NA
Xylenes, Total	1.9		1.0		ug/L	1		8260B	Total/NA

Client Sample ID: TRIP BLANK

Lab Sample ID: 720-33295-5

No Detections.

List Number: 1

Question	T / F / NA	Comment
Radioactivity either was not measured or, if measured, is at or below background	N/A	
The cooler's custody seal, if present, is intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	False	NCM
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
If necessary, staff have been informed of any short hold time or quick TAT needs	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True

To: Howard, Onieka
Subject: KEH PN GW006-additional samples

720-332914

Dear Ms. Howard,

Per our conversation today, I am requesting the lab re-analyze the following three soil samples using EPA Method 8015M with the silica gel clean up:

SAC1-7
SAC1-11
SAC4-18
(analytical report attached)

Thank you for your attention to this matter. If you have any questions, please let me know.

Jeffrey D. Borum, P.G., C.E.G.

Question	T / F / NA	Comment
Radioactivity either was not measured or, if measured, is at or below background	N/A	
The cooler's custody seal, if present, is intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	False	see ncm
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
If necessary, staff have been informed of any short hold time or quick TAT needs	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True

To Mike Olsen,

This is to confirm that the facility closure for Sears Auto Center located at 455 San Antonio Road in Mountain View, California has been completed according to the current guidelines established by the City of Mountain View Fire Department. This closure does not include the Sears Store also located at 455 San Antonio Road in Mountain View, California.

If you have any questions, do not hesitate to call our office at (650) 903-6378. Thank you for your cooperation in this project.

Sincerely,

A handwritten signature in black ink, which appears to read 'Patrick Mauri', is written over the word 'Sincerely,'.

SUBJECT PROPERTY RECONNAISSANCE AND INTERVIEW FORM

PROPERTY NAME: Machado-San Antonio Partners, L.L.C.
 ADDRESS/LOCATION: 405 South San Antonio Road, Mountain View, California
 CURRENT USE: Commercial Retail

		Interview (circle answer)	Property Visit
1A	Is the subject property currently used for an industrial purpose? Comments:	Yes <input type="radio"/> No <input checked="" type="radio"/>	Yes <input type="radio"/> No <input checked="" type="radio"/>
1B	Is any adjoining property currently used for an industrial use? Comments:	Yes <input type="radio"/> No <input checked="" type="radio"/>	Yes <input type="radio"/> No <input checked="" type="radio"/>
2A	Did you observe or do you have any prior knowledge that the Subject Property has been used for an industrial use in the past? Comments:	Yes / No <i>don't know</i>	Yes <input type="radio"/> No <input checked="" type="radio"/>
2B	Did you observe evidence or do you have any prior knowledge that any adjoining property has been used for an industrial use in the past? Comments:	Yes / No <i>don't know</i>	Yes <input type="radio"/> No <input checked="" type="radio"/>
3A	Is the Subject Property currently used as a gasoline station, motor repair facility, commercial printing facility, dry cleaners, photo developing laboratory, junkyard or landfill, or as a waste treatment storage, disposal processing or recycling facility? (if applies-which?) Comments:	Yes <input type="radio"/> No <input checked="" type="radio"/>	Yes <input type="radio"/> No <input checked="" type="radio"/>
3B	Is any adjoining property currently used as a gasoline station, motor repair facility, commercial printing facility, dry cleaners, photo developing laboratory, junkyard or landfill, or as a waste treatment storage, disposal processing or recycling facility? (if applies-which?) Comments: Former SEARS Auto Center Closed 2011	Yes <input checked="" type="radio"/> No <input type="radio"/>	Yes <input type="radio"/> No <input checked="" type="radio"/>
4A	Did you observe evidence or do you have any prior knowledge that the Subject Property has been used as a gasoline station, motor repair facility, commercial printing facility, dry cleaners, photo developing laboratory, junkyard or landfill, or as a waste treatment storage, disposal processing or recycling facility? (if applies-which?) City Directories list dry cleaners at 419 between 1962-1984 Comments:	Yes / No <i>no info on file</i>	Yes <input type="radio"/> No <input checked="" type="radio"/>
4B	Did you observe evidence, or do you have any prior knowledge that any adjoining property has been used as a gasoline station, motor repair facility, commercial printing facility, dry cleaners, photo developing laboratory, junkyard or landfill, or as a waste treatment storage, disposal processing or recycling facility? (if applies-which?) Former SEARS Auto Center and Former Mikes Shell Station Comments:	Yes <input checked="" type="radio"/> No <input type="radio"/> <i>↓ SEARS</i>	Yes <input type="radio"/> No <input checked="" type="radio"/>

5A	Are there currently any damaged or discarded automotive or industrial batteries, pesticides paints, or other chemicals in individual containers of > 5 gal. or >50gal. in the aggregate, stored on or used at the Subject Property? Comments:	Yes <input type="radio"/> No <input checked="" type="radio"/>	Yes <input type="radio"/> No <input checked="" type="radio"/>
5B	Did you observe evidence or do you have any prior knowledge that there have been previously any damaged or discarded automotive or industrial batteries pesticides, paints, or other chemicals in volume in individual containers of > 5 gal. or 50 gal. in the aggregate at the property or facility Comments:	Yes <input type="radio"/> No <input checked="" type="radio"/>	Yes <input type="radio"/> No <input checked="" type="radio"/>
6	Are there currently any industrial drums (55- gal.) or sacks of chemicals located on the Subject Property? Comments:	Yes <input type="radio"/> No <input checked="" type="radio"/>	Yes <input type="radio"/> No <input checked="" type="radio"/>
7A	Did you observe evidence or do you have <u>any prior knowledge</u> that fill dirt has been brought onto the Subject Property that originated from a contaminated site? Comments: <i>did not observe or evidence; no prior information available</i>	Yes <input type="radio"/> No <input checked="" type="radio"/>	Yes <input type="radio"/> No <input checked="" type="radio"/>
7B	Did you observe evidence or do you have <u>any prior knowledge</u> that fill dirt was brought onto the Subject Property that is of an unknown origin? Comments:	Yes <input type="radio"/> No <input checked="" type="radio"/> <i>ditto #7A</i>	Yes <input type="radio"/> No <input checked="" type="radio"/>
8A	Are there currently any pits, ponds, or lagoons located on the Subject Property in connection with waste treatment or waste disposal? Comments:	Yes <input type="radio"/> No <input checked="" type="radio"/>	Yes <input type="radio"/> No <input checked="" type="radio"/>
8B	Did you observe evidence or do you have <u>any prior knowledge</u> that there have been previously, any pits, ponds, lagoons located on the Subject Property in connection with waste treatment or waste disposal? Comments: <i>no prior information available</i>	Yes <input type="radio"/> No <input checked="" type="radio"/>	Yes <input type="radio"/> No <input checked="" type="radio"/>
9A	Is there currently any stained soil or other surface staining on the Subject Property? Comments: <i>Other than typical parking lot vehicle oil staining</i>	Yes <input type="radio"/> No <input checked="" type="radio"/> ←	Yes <input type="radio"/> No <input checked="" type="radio"/>
9B	Did you observe evidence or do you have <u>any prior knowledge</u> that there has been previously, any stained soil or other surface staining on the subject property? Comments: <i>no prior information available</i>	Yes <input type="radio"/> No <input checked="" type="radio"/>	Yes <input type="radio"/> No <input checked="" type="radio"/>
10A	Are there currently any registered or unregistered storage tanks (above or underground) located on the Subject Property? Comments:	Yes <input type="radio"/> No <input checked="" type="radio"/>	Yes <input type="radio"/> No <input checked="" type="radio"/>

10B	Did you observe evidence or do you have any prior knowledge that there have been previously, registered or unregistered storage tanks located on the Subject Property? Comments:	Yes / No <i>don't know</i>	Yes <input type="radio"/> No <input checked="" type="radio"/>
11A	Are there currently any vent pipes, fill pipes, or access ways indicating a fill pipe protruding from the ground on the Subject Property or adjacent to any structure located on the Subject Property? Comments:	Yes <input checked="" type="radio"/> No <input type="radio"/>	Yes <input type="radio"/> No <input checked="" type="radio"/>
11B	Did you observe evidence or do you have any prior knowledge that there have been previously, any vent pipes, fill pipes, or access ways indicating a fill pipe protruding from the ground on the Subject Property or adjacent to any structure located on the Subject Property? Comments:	Yes / No <i>don't know</i>	Yes <input type="radio"/> No <input checked="" type="radio"/>
12A	Are there currently any flooring, drains, or walls located within the Subject Property building that are stained by substances other than water or are emitting foul odors? Comments:	Yes <input checked="" type="radio"/> No <input type="radio"/>	Yes <input type="radio"/> No <input checked="" type="radio"/>
12B	Did you observe evidence or do you have any prior knowledge that there have been previously any flooring, drains, or walls located within the Subject Property building that are stained by substances other than water or are emitting foul odors? Comments:	Yes / No <i>don't know</i>	Yes <input type="radio"/> No <input checked="" type="radio"/>
13A	If the property is served by a private well or non-public water system, is there evidence or do you have prior knowledge that contaminants have been identified in the well or system that exceed guidelines applicable to the water system? Comments: Public Water Supply System	Yes / No <i>n/a</i>	Yes / No <i>n/a</i>
13B	If the property is served by a private well or non-public water system, is there any evidence or do you have prior knowledge that the well has been designated as contaminated by any government environmental/health agency? Comments: Public Water Supply System	Yes / No <i>n/a</i>	Yes / No <i>n/a</i>
14	Does the owner or occupant of the Subject Property have any knowledge of environmental liens or governmental notification relating to past or recurrent violations of environmental laws with respect to the Subject Property? Comments:	Yes <input checked="" type="radio"/> No <input type="radio"/>	Yes <input type="radio"/> No <input checked="" type="radio"/>

15A	Has the owner or occupant of the Subject Property been informed of the past existence of hazardous substances or petroleum products with respect to the property or any facility located on the Subject Property? Comments: Disclosed 2005 Phase I ESA discussed prior dry cleaners	Yes / No - don't know not on file	Yes (No) / No (Yes)
15B	Has the owner or occupant of the property been informed of the current existence of hazardous substances or petroleum products with respect to the Subject Property? Comments:	Yes (No) / No (Yes)	Yes (No) / No (Yes)
16	Does the owner or occupant of the Subject Property have any knowledge of any environmental site assessment of the Subject Property that indicated the presence of hazardous substances or petroleum products on, or contamination of, the Subject Property? Has further assessment of potential or known contamination, or mitigation of contamination, been recommended at the Subject Property? Comments:	Yes / No - don't know	Yes (No) / No (Yes)
17	Does the owner or occupant of the Subject Property know of any past, threatened, pending lawsuits, or administrative proceedings concerning a release or threatened release of any hazardous substance or petroleum products involving the Subject Property by any owner or occupant of the Subject Property? Comments:	Yes (No) / No (Yes)	Yes (No) / No (Yes)
18A	Does the Subject Property discharge waste water, other than storm water, into a storm drain system? Comments:	Yes (No) / No (Yes)	Yes (No) / No (Yes)
18B	Does the Subject Property discharge waste water, other than storm water, into a sanitary sewer system? Comments? Sewage only	Yes (No) / No (Yes) ←	Yes (No) / No (Yes)
19	Did you observe evidence or do you have any prior knowledge that any hazardous substances or petroleum products, unidentified waste materials, tires, automotive or industrial batteries, or any other waste materials have been dumped above grade, buried and/or burned on the Subject Property? Comments?	Yes (No) / No (Yes)	Yes (No) / No (Yes)
20	Is there a transformer, capacitor, or any hydraulic equipment located on the Subject Property for which there are any records indicating the presence of PCB's? Comments?	Yes / No don't know	Yes (No) / No (Yes)

21	<p>Do any of the following Federal Government record systems list the Subject Property or any site within the circumference of the area noted below?</p> <p>NPL (1 mile): 0</p> <p>CERCLIS (1/2 mile): 6 listed CERCLIS Sites- 5 closed, 1-certified OWM</p> <p>RCRA CORRACTS (1 mile): 0</p> <p>RCRA TSD (1 mile): 0</p> <p>Comments: See PHASE I ESA - ASTM E1527-05</p>	<p>Yes / No</p> <p>don't know</p>	<p>Yes / No</p> <p><input checked="" type="radio"/> No</p>

SCVWD ID No. 06S2W17N01f

INTRODUCTION

At the request of Exxon Mobil Corporation (Exxon Mobil), Environmental Resolutions, Inc. (ERI), assessed the status of the environmental investigation at the subject site. ERI reviewed documents and reports in its own files and on the web site of the County of Santa Clara Environmental Resources Agency, Department of Environmental Health, Hazardous Materials Compliance Division (the County). ERI performed this review, following a telephone conversation with the County, to facilitate consideration of this site for environmental case closure.

The site is located on the southwestern corner of San Antonio Road and California Street in Mountain View, California, as shown on the Site Vicinity Map (Plate 1). The locations of existing underground storage tanks (USTs), dispenser islands, and other select features are shown on Plate 2. Ownership of the property and UST system was transferred to Valero Energy Corporation (Valero) in June 2000. An independently operated Valero-branded service station currently occupies the site.

BACKGROUND

The environmental investigation at this site began in 1986. A detailed chronology of events at the site will be included in the Case Closure Summary form. Currently, there are nine on-site groundwater monitoring wells (MW1 through MW9), two on-site groundwater recovery wells (RW1 and RW2), one on-site UST observation well (TP1), five off-site groundwater monitoring wells (MW10, MW11, MW12A, MW12B, and MW13), and two off-site piezometers (PZ1 and PZ2).

Historical and recent groundwater monitoring and sampling data are summarized in Tables 1A and 1B. Select analytical results and groundwater elevations from the first quarter 2006 monitoring and sampling event are presented on Plates 3 and 4, respectively. Cumulative results of grab groundwater samples are presented in Tables 2A and 2B. Cumulative analytical results of soil samples are presented in Tables 3A and 3B. Well construction details are presented in Table 4. Details of the operation and performance of the groundwater extraction and treatment (GET) system are presented in Table 5 and Graph 1.

DISCUSSION

Stratigraphy

The hydrostratigraphy beneath the site and vicinity consists of three main hydrogeologic units, illustrated in the cross sections presented on Plates 4 through 8, and discussed in the following bulleted sections:

- An upper water-bearing zone consisting of gravelly and sandy layers interbedded with clayey and silty layers. This unit occurs from ground surface to approximately 16 to 23 feet below ground

surface (fbgs), and was encountered by the borings drilled on site and off site to date. Some of the gravelly and sandy layers appear to be continuous; others appear to be discontinuous lenses. Groundwater elevation data and dissolved hydrocarbon and methyl tertiary butyl ether (MTBE) concentration data collected from monitoring wells MW12A and MW12B (the only wells that are screened exclusively across separate gravelly layers within this unit) indicate the gravelly and sandy layers are hydraulically connected.

- An intermediate aquitard of clay, including plastic, dark bluish-gray to greenish-gray clay, which grades downward into clayey silt. This unit is partially penetrated by most borings drilled to date and is fully penetrated by direct-push borings GP3, GP15, and CPT1 through CPT3. Based on the sediment composition, this unit appears to have low permeability.
- A relatively thick lower water-bearing zone consisting of gravelly sand; clayey, gravelly sand; and sandy gravel, interbedded with silt and clay, which underlies the intermediate aquitard. This unit is partially penetrated by direct-push borings GP3, GP15, and CPT1 through CPT3. Groundwater in this unit in boring GP3 equilibrated at approximately 10.5 fbgs, suggesting that groundwater occurs under confined or semi-confined conditions within this layer.

Distribution of Hydrocarbon Concentrations in Soil

Petroleum hydrocarbons, including MTBE, have been detected in soil samples collected from on-site borings, particularly in the vicinity of the UST pit and the dispenser islands. Hydrocarbon concentrations in soil samples collected downgradient of the site are below or near laboratory reporting limits. Cumulative soil sample analytical results are presented in Tables 3A and 3B.

Sensitive Receptor Survey

ERI conducted an annual update of the Sensitive Receptor Survey in June 2006. There is one unconfirmed active production well located within a ¼-mile radius of the site. The well is No. 06S02W17M003, it is classified as a water-producing domestic well, it is located approximately 1,000 feet northwest (crossgradient) from the site (in the vicinity of 4376 Silva Court), and its existence could not be confirmed in the field. Based on the location of this well, crossgradient from the site, it is not considered to be a likely receptor.

The closest known active production well in the downgradient direction is No. 06S02W17L003, located approximately 1,400 feet northeast of the site, at 4265 Alma Street. ERI has sampled this well on a quarterly basis since April 2003, and petroleum hydrocarbons have not been detected at or above the laboratory reporting limits.

Groundwater Extraction and Treatment System

GET System Details

ERI constructed a GET system at the site in July 2003. The purpose of the GET system was to remove petroleum hydrocarbons from groundwater beneath the site. The GET system extracted groundwater from recovery wells RW1 and RW2 using submersible electric pumps. Extracted groundwater was directed through particulate filters for removal of suspended sediment, and three 2,000-pound granular activated carbon (GAC) vessels prior to discharge to the storm sewer. ERI collected water samples monthly at influent, intermediate, and effluent sample ports to ensure proper performance of the GET system.

GET System Data

The GET system operated from August 2003 to February 2005 and treated and discharged approximately 3,219,510 gallons of groundwater in accordance with a permit from the City of Mountain View Sanitation District. Operation and performance data for the GET system are summarized in Table 5. The amount of hydrocarbons removed from groundwater at the site is summarized in the following table:

Period	Volume of Groundwater Treated (gallons)	Mass of TPHg Removed (pounds)	Mass of Benzene Removed (pounds)	Mass of MTBE Removed (pounds)
8/8/03 - 2/5/05	3,219,510	<6.591	<0.0744	<0.927

Influent hydrocarbon concentrations decreased during the period of GET system operation. Concentrations of total petroleum hydrocarbons as gasoline (TPHg) were not detected in the influent samples at or above the laboratory reporting limits in the last four sampling events (November 2004 through February 2005). Concentrations of MTBE were not detected in the influent samples at or above the laboratory reporting limits in the last two sampling events (January and February 2005). The influent TPHg and MTBE concentrations over time are shown on Graph 1.

Groundwater Monitoring Data

Petroleum hydrocarbon concentrations in on-site groundwater monitoring wells decreased during remediation system operation. Concentrations of MTBE in groundwater monitoring well MW2 decreased from a maximum of 57,000 µg/L on October 15, 2001, to <0.50 µg/L on May 9, 2006. Concentrations of MTBE in groundwater monitoring well MW3 have decreased from a maximum of 50,600 µg/L on January 14, 2002, to 1.0 µg/L on May 9, 2006.

GET System Summary

Based on review of GET system and site data, ERI draws the following conclusions:

- The GET system processed 3,219,510 gallons of water and removed approximately 6.5 pounds of TPHg and 1 pound of MTBE.
- Influent TPHg, benzene, and MTBE concentrations were below laboratory reporting limits for at least the last two months of system operation.
- Benzene and MTBE concentrations in on-site groundwater monitoring wells declined to near or below the laboratory reporting limits.

Lateral and Vertical Delineation of Dissolved-Phase Hydrocarbons in Groundwater

Hydrocarbon concentrations are delineated laterally by current monitoring well data, by the transverse transects carried out in 2002, and by the longitudinal transect carried out in 2005. Plate 9 presents an MTBE isoconcentration map made with data from the 2002 investigation; Plate 10 presents an MTBE isoconcentration map made with data from 2005. The most recent quarterly monitoring and sampling data, from second quarter 2006 (Plate 2), indicate that concentrations of dissolved-phase hydrocarbons in groundwater continue to decrease at the site and vicinity.

On and near the site, monitoring wells MW7, MW9, and MW10 provide lateral delineation to the east and west. Monitoring wells MW1 and MW4 provide delineation to the south. In the 2005 investigation, the northern limit of hydrocarbon concentrations in groundwater was located near boring HP2a. Further north, samples collected from wells MW13, PZ1, and PZ2 have not contained hydrocarbon concentrations at or above the laboratory reporting limit.

Hydrocarbon concentrations in groundwater have been delineated vertically by the 2005 investigation. Samples collected from below 22 fbg in the HP borings showed no analytes at or above laboratory reporting limits, with the exception of various questionable detections of TPHd.

Comparison of 2002 Data to the 2005 Data

A comparison of the 2002 MTBE Isoconcentration Map (Plate 9) to the 2005 MTBE Isoconcentration Map (Plate 10) shows a significant reduction of the lateral extent of MTBE concentrations. The 100 µg/L contour on the 2002 map retreated approximately 500 feet on the 2005 map. In addition, the maximum concentration downgradient of the site within the area of hydrocarbon concentrations decreased from 19,900 µg/L at MW11 in 2002, to 347 µg/L at HP1 in 2005.

The most recent quarterly monitoring and sampling data from second quarter 2006 indicate that concentrations of dissolved-phase hydrocarbons in groundwater continue to decrease at the site and vicinity. ERI concludes that natural attenuation and the remediation of the site by the GET system are reducing the dissolved-phase hydrocarbons downgradient of the site. Because the GET system removed the MTBE source in groundwater, the concentrations will continue to decrease.

In summary, ERI concludes:

- A broadly consistent stratigraphy beneath the site and vicinity includes a clay layer at approximately 25 fbg that acts as an aquitard. No dissolved-phase hydrocarbons have been detected below this aquitard to date.
- Soil data collected downgradient of the site do not indicate that residual hydrocarbons are a secondary source of dissolved-phase hydrocarbons in groundwater downgradient of the site.
- The GET system processed approximately 3.2 million gallons of water and removed approximately 6.5 pounds of TPHg and 1 pound of MTBE. Influent TPHg, benzene, and MTBE concentrations were below laboratory reporting limits for at least the last two months of system operation.
- Hydrocarbon concentrations in groundwater are well-defined laterally and vertically as follows:
 - To the south by monitoring wells MW1 and MW4;
 - To the east by monitoring wells MW7 and MW8, and borings HP2, GP5, GP6, and GP14;
 - To the west by monitoring wells MW5, MW6, MW9, and MW10; and borings GP2, GP11, and GP12;
 - To the north by wells MW13, PZ1, and PZ2; and boring HP3; and
 - Vertically, by borings GP3, GP4, HP1, HP2a, and HP3.
- The extent of dissolved-phase MTBE concentrations in groundwater present in 2002 downgradient of the site has diminished. Because the site has been effectively remediated by the GET system, concentrations both on and off site will continue to decrease via natural attenuation.

CONCLUSIONS

Based on the review of site data, ERI draws the following conclusions:

- Concentrations of dissolved-phase hydrocarbon constituents of concern in groundwater monitoring wells at the site and vicinity have decreased by one to four orders of magnitude.
- Decreasing hydrocarbon concentrations in the groundwater monitoring wells at the site and vicinity indicate that natural attenuation processes are occurring.
- There are no sensitive receptors, including water production wells, within a ¼-mile downgradient of the site.

- Environmental case closure and destruction of the wells at the site is appropriate at this time.

LIMITATIONS

This report was prepared in accordance with generally accepted standards of environmental practice in California at the time this report was written. This investigation was conducted solely for the purpose of evaluating environmental conditions of the soil and groundwater. No soil engineering or geotechnical references are implied or should be inferred. Evaluation of the geologic conditions at the site for the purpose of this investigation is made from a limited number of observation points. Subsurface conditions may vary away from the data points available. Additional work, including further subsurface investigation, can reduce the inherent uncertainties associated with this type of investigation. This report has been prepared solely for Exxon Mobil, and any reliance on this report by third parties shall be at such party's sole risk.

DOCUMENT DISTRIBUTION

ERI recommends forwarding copies of this report to:

Ms. Lani Lee
Santa Clara County
Department of Environmental Health
1555 Berger Drive, Suite 300
San Jose, California 95112-2716

Mr. Robert C. Ehlers, M.S., P.E.
The Valero Companies
Environmental Liability Management
685 West Third Street
Hanford, California 93230

Please call Mr. Geoffrey V. Waterhouse, ERI's project manager for this site, at (707) 766-2000 with any questions regarding this report.

Sincerely,
Environmental Resolutions, Inc.

TABLE 1A
 CUMULATIVE GROUNDWATER MONITORING AND SAMPLING DATA
 Former Exxon Service Station 7-0230
 334 San Antonio Road
 Mountain View, California
 (Page 28 of 28)

Notes:	=	Data prior to March 1999, provided by EA Engineering, Science, and Technology.
TOC	=	Top of well casing elevation; datum is mean sea level
SUBJ	=	Results of subjective evaluation, liquid-phase hydrocarbon thickness (HT) in feet.
NLPH	=	No liquid-phase hydrocarbons present in the well.
DTW	=	Depth to water.
GW Elev.	=	Groundwater elevation; datum is mean sea level.
TOG	=	Total oil and grease analyzed using EPA Method 418.1.
TPHd	=	Total petroleum hydrocarbons as diesel analyzed using EPA Method 8015 modified.
TPHg	=	Total petroleum hydrocarbons as gasoline analyzed using EPA Method 8015 modified.
MTBE	=	Methyl tertiary butyl ether analyzed using EPA Method 8260B. Prior to 10/10/03, analyzed using EPA Method 8021B or as noted.
BTEX	=	Benzene, toluene, ethylbenzene, and total xylenes analyzed using EPA Method 8260B. Prior to 05/13/04, analyzed using EPA Method 8021B or as noted.
Ethanol	=	Ethanol analyzed using EPA Method 8260B.
EDB	=	1,2-Dibromoethane analyzed using EPA Method 8260B.
1,2-DCA	=	1,2-Dichloroethane analyzed using EPA Method 8260B.
TAME	=	Tertiary amyl methyl ether analyzed using EPA Method 8260B.
TBA	=	Tertiary butyl alcohol analyzed using EPA Method 8260B.
ETBE	=	Ethyl tertiary butyl ether analyzed using EPA Method 8260B.
DIPE	=	Di-isopropyl ether analyzed using EPA Method 8260B.
fmsl	=	Feet above mean sea level.
fbgs	=	Feet below ground surface.
µg/L	=	Micrograms per liter.
---	=	Not analyzed/Not measured/Not sampled.
<	=	Less than the stated laboratory report limit.
ND	=	Not detected at reporting limit.
FP	=	Free product. No thickness data available.
a	=	Analyzed using EPA Method 8260B.
b	=	Reported value may be elevated due to non-diesel batch contamination. No fuel pattern observed.
c	=	Unidentified hydrocarbons present.
d	=	Diesel-range hydrocarbons reportedly detected in bailer blank; result is suspect.
e	=	Diesel-range organic compounds reported in sample; however, the chromatogram pattern is not representative of diesel fuel.
f	=	Report limits that differ from previously reported values are due to extracted volumes being less than 1,000ml (1L).
g	=	Remediation system was down; unable to sample.
h	=	Analyte detected in Method Blank. Results suspect.

January 19, 2001: Samples are noted in Chain-of-Custody and laboratory analysis report as January 22, 2001; however, the correct date is January 19, 2001.

TABLE 1B
 ADDITIONAL CUMULATIVE GROUNDWATER MONITORING AND SAMPLING DATA
 Former Exxon Service Station 7-0230
 334 San Antonio Road
 Mountain View, California
 (Page 11 of 11)

Notes:	=	Data prior to March 1999, provided by EA Engineering, Science, and Technology.
TOC	=	Top of well casing elevation; datum is mean sea level
SUBJ	=	Results of subjective evaluation, liquid-phase hydrocarbon thickness (HT) in feet.
NLPH	=	No liquid-phase hydrocarbons present in the well.
DTW	=	Depth to water.
GW Elev.	=	Groundwater elevation; datum is mean sea level.
TPHd	=	Total petroleum hydrocarbons as diesel analyzed using EPA Method 8015 modified.
TPHg	=	Total petroleum hydrocarbons as gasoline analyzed using EPA Method 8015 modified.
MTBE	=	Methyl tertiary butyl ether analyzed using EPA Method 8260B. Prior to 10/10/03, analyzed using EPA Method 8021B or as noted.
BTEX	=	Benzene, toluene, ethylbenzene, and total xylenes analyzed using EPA Method 8260B. Prior to 05/13/04, analyzed using EPA Method 8021B or as noted.
Ethanol	=	Ethanol analyzed using EPA Method 8260B.
EDB	=	1,2-Dibromoethane analyzed using EPA Method 8260B.
1,2-DCA	=	1,2-Dichloroethane analyzed using EPA Method 8260B.
TAME	=	Tertiary amyl methyl ether analyzed using EPA Method 8260B.
TBA	=	Tertiary butyl alcohol analyzed using EPA Method 8260B.
ETBE	=	Ethyl tertiary butyl ether analyzed using EPA Method 8260B.
DIPE	=	Di-isopropyl ether analyzed using EPA Method 8260B.
Add'l HVOCs	=	Additional halogenated volatile organic compounds analyzed using EPA Method 8010.
fmsl	=	Feet above mean sea level.
fbgs	=	Feet below ground surface.
µg/L	=	Micrograms per liter.
—	=	Not analyzed/Not measured/Not sampled.
<	=	Less than the stated laboratory report limit.
ND	=	Not detected at reporting limit.
FP	=	Free product. No thickness data available.
a	=	Analyzed using EPA Method 8260B.
b	=	Reported value may be elevated due to non-diesel batch contamination. No fuel pattern observed.
c	=	Unidentified hydrocarbons present.
d	=	Diesel-range hydrocarbons reportedly detected in bailer blank; result is suspect.
e	=	Diesel-range organic compounds reported in sample; however, the chromatogram pattern is not representative of diesel fuel.
f	=	Report limits that differ from previously reported values are due to extracted volumes being less than 1,000ml (1L).
g	=	Remediation system was down; unable to sample.
h	=	Analyte detected in Method Blank. Results suspect.

January 19, 2001: Samples are noted in Chain-of-Custody and laboratory analysis report as January 22, 2001; however, the correct date is January 19, 2001.

Notes:

- W-16-GP1 == Water sample-depth-boring number
- TPHg == Total petroleum hydrocarbons as gasoline analyzed using EPA Method 8015B/8020 (modified).
- TPHd == Total petroleum hydrocarbons as diesel analyzed using EPA Method 8015 (modified).
- MTBE == Methyl tertiary butyl ether analyzed using EPA Method 8260B.
- BTEX == Benzene, toluene, ethylbenzene, and total xylenes analyzed using EPA Method 8021b; prior to 08/15/02, analyzed using EPA Method 8020.
- ETBE == Ethyl tertiary butyl ether analyzed using EPA Method 8260B.
- TAME == Tertiary amyl methyl ether analyzed using EPA Method 8260B.
- TBA == Tertiary butyl alcohol analyzed using EPA Method 8260B.
- 1,2-DCA == 1,2-dichloroethane analyzed using EPA Method 8260B.
- EDB == 1,2-dibromoethane analyzed using EPA Method 8260B.
- DIPE == Di-isopropyl ether analyzed using EPA Method 8260B.
- Ethanol == Ethanol analyzed using EPA Method 8260B; prior to 08/15/02, analyzed using EPA Method 8015B.
- Methanol == Methanol analyzed using EPA Method 8015 (modified).
- fbs == Feet below ground surface.
- µg/L == Micrograms per liter.
- < == Less than the stated laboratory reporting limit.
- == Not sampled/Not analyzed.
- a == TPHd re-analyzed using silica gel cleanup.
- b == Chromatogram pattern is not consistent with diesel fuel.
- c == Insufficient water to sample.

Notes:

- S-10-GP1 = Soil - sample depth - boring number.
- TPHg = Total petroleum hydrocarbons as gasoline analyzed using EPA Method 8015B.
- TPHd = Total petroleum hydrocarbons as diesel analyzed using EPA Method 8015B.
- MTBE = Methyl tertiary butyl ether analyzed using EPA Method 8021B.
- BTEX = Benzene, toluene, ethylbenzene, and total xylenes analyzed using EPA Method 8020 or 8021B.
- TBA = Tertiary butyl alcohol analyzed using EPA Method 8260. Prior to September 2005, analyzed using EPA Method 8010B.
- DIPE = Di-Isopropyl ether (Isopropyl ether) analyzed using EPA Method 8260B. Prior to September 2005, analyzed using EPA Method 8010B.
- ETBE = Ethyl tertiary butyl ether analyzed using EPA Method 8260B. Prior to September 2005, analyzed using EPA Method 8010B.
- EDB = 1,2-dibromoethane analyzed using EPA Method 8260B. Prior to September 2005, analyzed using EPA Method 8010B.
- Total Lead = Lead analyzed using EPA Method 6010.
- Add'l VOCs = Additional volatile organic compounds analyzed using EPA Method 8010B.
- Methanol = Methanol analyzed using EPA Method 8015B.
- Ethanol = Ethanol analyzed using EPA Method
- fbs = Feet below ground surface.
- mg/kg = Milligrams per kilogram.
- = Not measured/Not sampled/Not analyzed.
- < = Not detected at or above the stated laboratory method detection limits.
- ND = All analytes not detected at or above the laboratory method detection limits; see laboratory report for complete list.
- a = Hydrocarbon pattern is present in the requested fuel quantitation range but does not resemble the pattern of the requested fuel.
- b = Analyzed using EPA Method 8260B.
- c = Also sampled for total recoverable petroleum hydrocarbons, semi-volatile organic compounds, and metals. See original reports for analytes and reporting limits.

TABLE 3B
ADDITIONAL CUMULATIVE ANALYTICAL RESULTS OF SOIL SAMPLES
Former Exxon Service Station 7-0230
334 San Antonio Road
Mountain View, California
(Page 3 of 3)

Notes:

S-10-GP1	= Soil - sample depth - boring number.
TPHg	= Total petroleum hydrocarbons as gasoline analyzed using EPA Method 8015B.
TPHd	= Total petroleum hydrocarbons as diesel analyzed using EPA Method 8015B.
MTBE	= Methyl tertiary butyl ether analyzed using EPA Method 8021B.
BTEX	= Benzene, toluene, ethylbenzene, and total xylenes analyzed using EPA Method 8020 or 8021B.
TBA	= Tertiary butyl alcohol analyzed using EPA Method 8260. Prior to September 2005, analyzed using EPA Method 8010B.
DIPE	= Di-isopropyl ether (Isopropyl ether) analyzed using EPA Method 8260B. Prior to September 2005, analyzed using EPA Method 8010B.
ETBE	= Ethyl tertiary butyl ether analyzed using EPA Method 8260B. Prior to September 2005, analyzed using EPA Method 8010B.
EDB	= 1,2-dibromoethane analyzed using EPA Method 8260B. Prior to September 2005, analyzed using EPA Method 8010B.
Total Lead	= Lead analyzed using EPA Method 6010.
Add'l VOCs	= Additional volatile organic compounds analyzed using EPA Method 8010B.
Methanol	= Methanol analyzed using EPA Method 8015B.
Ethanol	= Ethanol analyzed using EPA Method
fbgs	= Feet below ground surface.
mg/kg	= Milligrams per kilogram.
--	= Not measured/Not sampled/Not analyzed.
<	= Not detected at or above the stated laboratory method detection limits.
ND	= All analytes not detected at or above the laboratory method detection limits; see laboratory report for complete list.
a	= Hydrocarbon pattern is present in the requested fuel quantitation range but does not resemble the pattern of the requested fuel.
b	= Analyzed using EPA Method 8260B.
⊕	= Also sampled for total recoverable petroleum hydrocarbons, semi-volatile organic compounds, and metals. See original reports for analytes and reporting limits.

Site History

The Site is adjacent and downgradient of the Plessey Micro Science site at 2274-2296 Mora Drive. Plessey used underground neutralization tanks in its printed circuit board manufacturing activities at the Plessey site. Investigations found that the tanks leaked VOCs and contaminated the surrounding soil and groundwater that extended to the Site. The investigations conducted on site did not find source areas at the Site. Groundwater contamination at the Site is addressed as part of the Plessey site cleanup. Ryland Homes acquired the Site in 2001 and redeveloped it into townhomes with restrictions on groundwater use.

Land Use Restrictions

DISCLAIMER: The land use restrictions listed under the site management requirements are only an abbreviated summary of the land use restrictions, and may not encompass all restrictions and notification requirements placed on a property. For complete land use restriction information please see the Land Use Restriction document by, clicking on the "VIEW COVENANT" link.

CEQA Storm Drainage Analysis Memorandum

MEMORANDUM

DATE: December 5, 2013

TO: Erin Efner and Elizabeth Antin, ICF International

FROM: Wen Chen, Nona Espinosa and Jill Sylvester, Nolte Vertical Five

PROJECT: Village at San Antonio Center Phase II CEQA Analysis

PROJECT #: SJB036803

SUBJECT: CEQA Storm Drainage Analysis Memorandum-FINAL

BACKGROUND

ICF International is preparing a CEQA analysis of the Village at San Antonio Center Phase II Redevelopment (Project) for the City of Mountain View (City). Nolte Associates, Inc (a subsidiary of NV5) has been asked to provide storm drainage support services for this CEQA analysis. NV5's scope includes an analysis of the existing and proposed 10-year design storm site discharge as well as the potential impacts of groundwater flows contributing to the City's storm drainage system. Currently, the Project site is the home of six one-story commercial buildings with associated at-grade parking and minor landscaping. The Project is located at the southeast corner of California Street and San Antonio Road, south of Central Expressway. Along California Street, the project limits extend from San Antonio Road to Paccetti Way. The Project location is depicted in Figure 1 (see attachments).

The Project will modify an existing, developed site from commercial usage to planned urban design commercial usage. Along San Antonio Road, the proposed Project site will include office buildings with commercial, retail and restaurant spaces on the ground floor, and a subterranean parking garage. A plaza is proposed for the center of the Project site. Along the southeasterly side of the plaza, the proposed Project includes a hotel and cinema with retail spaces on the ground floor. A proposed parking structure will be located between the hotel and cinema and will consist of multiple above grade parking levels and one below grade parking level. A copy of the Project EIR Submittal proposed site plan (A1.01 by RTKL) is included in the attachments to this memorandum. [1] An analysis of the hydrologic and hydraulic effects of the proposed Project on the City's downstream storm drainage system is detailed in this technical memorandum.

Based on a preliminary geotechnical investigation, the groundwater table will impact the design of the subterranean parking structures. Consequently, there is a potential need for the groundwater to be collected, pumped, and discharged to the City's storm drainage system. A discussion of groundwater impacts is included in this memorandum.

STORM DRAINAGE ANALYSIS

The existing storm drainage system near the proposed Project was analyzed based on the Bentley StormCAD model developed for the City of Mountain View's August 2005 *Citywide Storm Drainage Master Plan* (SDMP) [2]. Based on the City's design standards, the 10-year storm event was used for the modeling. Surface runoff calculations follow the Rational Method per the *Santa Clara County Drainage Manual 2007* (Drainage Manual) [3]. Figure 2 depicts the watersheds in the Adobe Creek East (ACE) System, analyzed in the SDMP. The Project site is located in watershed AA-SDF1-022 in the ACE System, and free outfall is assumed within Adobe Creek.

Figure 1 illustrates the existing storm drainage system near the Project. The existing drainage system along California Street includes a 27-inch main west of Pacchetti Way that expands to 30-inch diameter prior to connection to the 36-inch main along San Antonio Road. The existing drainage system along San Antonio Road includes a 33-inch main north of Fayette Drive that expands to 36-inch diameter prior to the manhole connection at San Antonio Road and California Street. North of California Street, the 36-inch main extends along San Antonio Road and expands to 42-inch diameter prior to connection with the 80-inch ACE trunk system.

Methodology

The model of the existing ACE storm drainage system from the SDMP is limited to the main trunk system located generally along the south side of Central Expressway as depicted in Figure 2. The SDMP ACE System StormCAD model was modified to include the San Antonio Road/California Street sub-system near the Project site. For this analysis, the model was expanded to include piping and drainage inlets along San Antonio Road (south along westerly Project boundary) and east along California Street to Pacchetti Way. The piping added to the model is depicted in Figure 1 and Figure 3. Nine additional watersheds within ACE watershed area AA-SDF1-022 were delineated as shown in Figure 3.

The Rational Method is a procedure for calculating peak surface runoff flow rates. The variables in the rational formula are surface area, intensity of rainfall, runoff coefficient, and runoff time of concentration. For this analysis, the rainfall intensity, runoff coefficient (C) and runoff time of concentration (t_c) from the SDMP were used. Tables describing the runoff coefficients (Table 1) and time of concentration values (Table 2) used for each watershed area are included in the attachments to this memorandum. The runoff time of concentration (t_c) was calculated for each watershed in the San Antonio Road/California Street sub-system. However, the overall system time of concentration was kept consistent between the SMDP model and the existing conditions San Antonio model (SanAntonio_EXIST-SYS_ACE_A_V8i-rev1.stsw).

Pre-Project Condition

The San Antonio model was run for a 10-year design storm with the existing flows estimated for the ACE System in the SDMP. The stormwater flow estimated for watershed AA-SDF1-022 was distributed throughout the subsystem per the watershed delineation. The model output results of the San Antonio model were compared to the SDMP model results for verification of consistency with the SDMP. Profiles and modeling analysis tables are included in the attachments to this memorandum. See Table 3 for a table of the existing conditions model output. Profile 1 illustrates the

modeling results for the system from California Street to the SDMP trunk system. Profile 2 illustrates the modeling results for the system from San Antonio Road to the SDMP trunk system. Modeling output (profiles and tables) confirm consistency between the San Antonio model (ACE trunk line with San Antonio Road/California Street sub-system) and SDMP model (ACE trunk line **without** San Antonio Road/California Street sub-system).

The Drainage Manual states that a minimum 1 foot freeboard from the hydraulic grade line (HGL) to nearest gutter flow line is required for an existing storm drainage system to be considered adequate. [3] The San Antonio existing conditions model predicted a minimum freeboard of 2.25 feet (from manhole rim to HGL) along the modeled California Street storm drain and minimum freeboard of 4.89 feet along the modeled San Antonio Road storm drain (south of California Street). Thus, modeling results indicate that the existing City drainage system is adequate for the 10-year storm event per the Drainage Manual criteria. However, it should be noted that along California Street there is an interconnection between the storm drain system for SDMP watershed AA-SDF1-022 (where the Project is located) and the storm drain system for upstream SDMP watershed AA-SDF2-003. Refer to Figure 3 for location of the interconnection. There is a potential for the California Street sub-system (watershed AA-SDF1-022) to receive storm flows from the upstream watershed AA-SDF2-003 through the interconnection. A sensitivity analysis was performed to evaluate the impact of these potential bypass storm flows.

If the upstream drainage system (watershed AA-SDF2-003) along California Street is surcharging during a storm event, flows from the upstream system may be discharged to the California Street sub-system (watershed AA-SDF1-022). A sensitivity analysis was performed and the AA-SDF1-022 system along California Street will accept up to 5 cubic feet per second (cfs) bypass flows before localized flooding occurs at California Street. (The model predicts a bypass flow of 6 cfs results in localized flooding.) This is a relatively small amount of flow indicating that the existing California Street sub-system is sensitive to additional flows because of the existing high HGL.

The pre-Project condition modeling analysis identified an inherent weakness in the California Street/San Antonio Road sub-system. The existing 30-inch storm drain along California Street and the existing 36-inch diameter storm drain along San Antonio Road (south of California St) discharge to a 36-inch storm drain located north of California Street. The predicted flow through the 36-inch diameter San Antonio Road storm drain that extends 356 lineal feet (LF) north from California Street to San Antonio Circle is approximately 80 cfs, and the full pipe capacity is approximately 64 cfs. This indicates that the existing 36-inch diameter storm drain is operating in a surcharge condition and is a system weakness. Modeling analysis suggests that the surcharge condition of the 36-inch San Antonio Road storm drain results in a high HGL in the California Street sub-system. The existing conditions model predicted flooding at California Street when a relatively small bypass flow (6 cfs) was discharged to the California Street sub-system from the upstream watershed. Conceptual solutions to address the system weakness will be discussed later in this memorandum.

Post-Project Condition

The Project will modify an existing, developed site from commercial usage to planned urban design commercial usage. Six one-story commercial buildings with associated at-grade parking and minor landscaping will be replaced. Along San Antonio Road, the proposed Project site will include office buildings with commercial, retail and restaurant spaces on the ground floor, and a subterranean

parking garage. A plaza is proposed for the center of the Project site. Along the southeasterly side of the plaza, the proposed Project includes a hotel and cinema with retail spaces on the ground floor. A proposed parking structure will be located between the hotel and cinema and will consist of multiple above grade parking levels and one below grade parking level. [1]

The variable in the rational formula (for calculating peak surface runoff flow rates) that would change with redevelopment of the site is the runoff coefficient (C). Runoff coefficients vary depending on whether the surface is pervious (landscaping) or impervious (concrete or asphalt). The quantity of landscaped area at the existing site (approximately 0.53 acres) was estimated based on aerial photography. Figure 4 depicts the existing landscaped area calculation. The quantity of landscaped area for the proposed site (approximately 0.55 ac) was estimated based on Project EIR Submittal proposed Landscape Plan (L1.01 by RTKL) that is included in the attachments to this memorandum. [4] Figure 5 depicts the proposed landscaped area calculation.

Table 1: Pervious Area Summary

Site Condition	Pervious Area
Existing	0.53 ac
Proposed	0.55 ac

The total area of the AA-SDF1-022 watershed (where the Project is located) is approximately 103 acres. The Project site is approximately 10.5 acres. Pervious surfaces have a lower runoff coefficient than impervious surfaces. The modest change in the quantity of landscaped (pervious) area within the Project area dictates that the 10-year storm flow for the proposed site condition would be the same or slightly less than the existing SDMP 10-year storm flow. To be conservative, the proposed site stormwater runoff was assumed to be equivalent to existing condition stormwater flows.

The California Street/San Antonio Road sub-system watershed delineation was modified to reflect anticipated new drainage patterns following redevelopment of the Project site. Figure 6 depicts the watershed delineation for the proposed Project. Tables describing the runoff coefficients (Table 1) and time of concentration values (Table 4) used for each watershed area are included in the attachments to this memorandum. The runoff time of concentration (t_c) was calculated for each watershed in the San Antonio Road/California Street sub-system. However, the overall system time of concentration was kept consistent between the SMDP model and the proposed conditions San Antonio model (SanAntonio_Pr-SYS_ACE_A_V8i-rev2.stsw).

A portion of the proposed onsite storm drain system included in Project EIR Submittal proposed Utility Plan C3.00 (see attachments) was modeled to evaluate the post-project condition. Figure 6 depicts the proposed onsite drainage system that was added to the model. Per the proposed Utility Plan, a proposed 24-inch diameter storm drain would extend through the middle of the Project site for connection with the 27-inch storm drain along California Street. In addition to the proposed onsite 24-inch storm drain, the existing onsite 12-inch storm drain extending along the southeasterly Project boundary (Pacchetti Way) was included in the proposed conditions San Antonio model. Per the Utility Plan, the proposed Project will discharge to this existing onsite 12-inch storm drain.

See Table 5 for the proposed conditions model output. Profile 3 illustrates the modeling results for the system from California Street to the SDMP trunk system. Profile 4 illustrates the modeling results for the system from San Antonio Road to the SDMP trunk system. Model results indicated an onsite storm drain system deficiency at modeled inlet “AA-SDF1-022-J,” at the upstream end of the existing onsite 12-inch storm drain that extends along the southeasterly Project boundary (Pacchetti Way). (For the location of inlet “AA-SDF1-022-J,” see “Proposed Conditions Model Exhibit” included in the attachments.) The existing 12-inch storm drain discharges to the existing 27-inch storm drain along California Street. The hydraulic grade line (HGL) at inlet “AA-SDF1-022-J” exceeded the inlet grate (ground) elevation, predicting flooding during the 10-year storm event.

The Drainage Manual states that a minimum 1 foot freeboard from the hydraulic grade line (HGL) to nearest gutter flow line is required for an existing storm drainage system to be considered adequate. [3] The San Antonio proposed conditions model predicted a minimum freeboard of 2.42 feet (from manhole rim to HGL) along the modeled California Street storm drain and minimum freeboard of 4.68 feet along the modeled San Antonio Road storm drain (south of California Street). Thus, modeling results indicate that the existing City drainage system is adequate for the 10-year storm event per the Drainage Manual criteria. The existing system weakness identified as the 36-inch diameter main along San Antonio Road (north of California Street) remains in the proposed conditions model.

CONCEPTUAL SOLUTION DEVELOPMENT

An existing system weakness was identified in the discussion of the pre-Project condition. The model indicated that the 356 LF 36-inch storm drain along San Antonio Road, extending north from California Street to San Antonio Circle, operates in a surcharge condition during the 10-year storm event. In addition, there is a manhole interconnection between the California Street sub-system for the AA-SDF1-022 watershed and the upstream watershed AA-SDF2-003 along California Street. The existing storm drain system meets Drainage Manual criteria for minimum freeboard for the 10-year storm event. To evaluate a solution to address the existing system weakness, the proposed conditions model was run with upgrading the existing 356 LF 36-inch main along San Antonio Road, just north of California Street. The model predicted that by upgrading the existing 356 LF 36-inch diameter main to 42-inch diameter (with pipe slope equal to existing slope of 0.009), the California Street sub-system HGL is sufficiently lowered for the 10-year storm event. See attached Profile 5 (model output) that illustrates the existing storm drainage system with the existing 356 LF 36-inch diameter main upgraded to 42-inch diameter. Figure 7 illustrates the location of the recommended improvement.

In regard to the proposed onsite storm drain system, the model predicted flooding at storm drain inlet “AA-SDF1-022-J” indicating that the existing 12-inch diameter storm drain along the southeasterly Project boundary (Pacchetti Way) does not have sufficient capacity to convey anticipated 10-year storm event runoff. The Project EIR Submittal proposed Utility Plan shows treated stormwater runoff from the roof of proposed buildings and treated runoff from the road would discharge to the existing 12-inch storm drain. The proposed conditions model predicted that by upgrading the existing 12-inch diameter storm drain to 18-inch diameter, adequate freeboard and system capacity is achieved. Modeling results indicate that the proposed 24-inch diameter extending through the middle of the site would convey treated stormwater from the roof of proposed buildings and treated runoff from the road. It appears that a 12-inch diameter main would provide sufficient capacity to convey the

anticipated 10-year storm event runoff. However, the intent of the 24-inch main may be to also provide capacity to convey groundwater pumped from the proposed underground parking levels.

Groundwater

Groundwater is a potential concern, given the proposed underground parking levels. Along San Antonio Road, the proposed Buildings 1 and 2 include a subterranean parking garage. According to the Project EIR Submittal plans, three or four basement parking levels are planned. The Project EIR Submittal proposed building sections sheet A6.00 shows three basement parking levels and sheet A2.04 depicts a plan view for basement level 4. (See attachments for A6.00 and A2.04). [1] According to A6.00, the proposed parking structure for Buildings 5 and 6 (located between the hotel and cinema) will consist of multiple above grade parking levels and one below grade parking level.

A preliminary geotechnical investigation of the Project site conducted in February 2013 encountered groundwater at depths between 12 feet and 17 feet below ground surface, corresponding to elevations of about 38.5 feet to 43 feet. [5] The geotechnical report summarizing the preliminary investigation recommended a design groundwater elevation of 43 feet.

Figure 8 depicts a profile of the storm drain system along San Antonio Road. The finished grade of the proposed building 1 and 2 is 57 feet and the proposed subterranean parking floor elevation (assuming four basement parking levels) is approximately 16.5 feet. With a design groundwater elevation of 43 feet, the groundwater elevation is much higher than the proposed subterranean parking floor elevation of 16.5 feet. In addition the storm drain system along San Antonio Road is higher than the proposed subterranean parking floor elevation. Along the San Antonio Road frontage of the Project site the existing storm drain system varies in elevation from an invert of approximately 44.5 feet to approximately 39.3 feet, as depicted in Figure 8.

Figure 9 depicts a profile of the storm drain system along California Street. The finished grade of the proposed building 5 and 6 is 52 feet, and the proposed subterranean parking floor elevation is approximately 39 feet. With a design groundwater elevation of 43 feet, the groundwater elevation is higher than the proposed subterranean parking floor elevation of 39 feet. Along the California Street frontage of the Project site the existing storm drain system varies in elevation from an invert of approximately 43.6 feet to approximately 39.3 feet, as depicted in Figure 9.

It is recommended that the buildings with subterranean garages be designed and constructed to prevent groundwater intrusion. A French drain system should be considered for installation adjacent to the building foundation, but above the design groundwater elevation. Depending on the final floor elevation of the subterranean parking structure, a submersible pump will likely be required to convey flow collected by the French drain system to the existing storm drain system along San Antonio Road or California Street. Additionally, check valves should be installed on the site drainage system and the French drain system (adjacent to subterranean parking structures) prior to connection to the City's storm drainage system, to prevent backflows at the Project site.

EXECUTIVE SUMMARY

This report presents the results of the transportation impact analysis (TIA) for Phase 2 of the proposed mixed-use development known as The Village at San Antonio Center located in the City of Mountain View, California. The Project site is located south of California Street between San Antonio Road and Pacchetti Way. The proposed project will contain a 167-room hotel, 54,184 square feet of retail space, 392,853 square feet of office space, 28,502 square feet of flexible commercial space, 35,358 square feet of restaurant space, and a cinema with 1,710 seats.

Transportation aspects of the project were evaluated for consistency with the City of Mountain View 2030 *General Plan* (2012). The impacts of the Project were evaluated following the guidelines of the City of Mountain View and the Santa Clara Valley Transportation Authority (VTA), the congestion management agency for Santa Clara County. Roadway system operations were evaluated under the following study scenarios:

- Existing Conditions
- Existing Plus Project Conditions
- Background Conditions
- Background Plus Project Conditions
- Cumulative Near-Term Project Conditions
- Cumulative Near-Term Plus Project Conditions

Pedestrian, bicycle, and transit facilities were also evaluated.

PROJECT TRAFFIC ESTIMATES

Project-generated vehicle trips were estimated using rates and equations published by the Institute of Transportation Engineers (ITE). The proposed Project is estimated to generate 5,983 daily vehicle trips, with 571 occurring during the AM peak hour (472 in and 99 out), and 839 occurring during the PM peak hour (278 in and 561 out).

PROJECT IMPACTS

This analysis identifies potentially significant adverse impacts of the proposed project on the surrounding transportation system and recommends measures to mitigate significant impacts for environmental clearance.

INTERSECTION IMPACTS

Existing Plus Project Conditions

The results of the Level of Service (LOS) calculations indicate that all of the study intersections still operate at acceptable levels of service in the Existing Plus Project scenario.

Background Plus Project Conditions

The results of the Level of Service (LOS) calculations indicate that all of the study intersections still operate at acceptable levels of service in the Background Plus Project scenario.

Cumulative Near-Term Plus Project Conditions

Significantly impacted intersection locations under Cumulative Near-Term Plus Project Conditions during the AM or PM peak hour include:

- *San Antonio Road and El Camino Real (Intersection #6; PM Peak)*

San Antonio Road and California Street Re-Configuration Test

The City had asked for a test of a possible re-configuration for the southbound approach at the intersection of San Antonio Road and California Street. The re-configuration would convert one southbound through lane to a left-turn lane. The test determined that in Cumulative Near-Term Plus Project Conditions, the re-configured intersection operates acceptably during both peak hours.

FREEWAY SEGMENT IMPACTS

On freeway segments that are already operating at LOS F during the AM and PM peak period, the project traffic would not add more than one percent of the freeway's capacity. On freeway segments that are currently operating at LOS E or better, the project traffic would not cause the LOS to decline to LOS F. Therefore, the project is estimated to have a less-than-significant impact on the freeway system.

PEDESTRIAN, BICYCLE, AND TRANSIT IMPACTS

Pedestrian Facilities

Most signalized intersections within one-quarter mile of the project site have crosswalks and pedestrian signals on all four legs. In addition, there is a mid-block, unsignalized crosswalk on San Antonio Road at Miller Avenue near the intersection of San Antonio Road and California Street. Although the Project would generate vehicles that would cross existing pedestrian facilities on a regular basis, the existing facilities are designed adequately, resulting in a less-than-significant impact.

To accommodate higher pedestrian volumes due to the Project, it is recommended that the pedestrian crossings at the intersection of intersection of California Street and Pacchetti Way be enhanced with high visibility crosswalks, corner bulbouts and signage. No intersection widening is currently proposed as a result of vehicle LOS mitigation, although re-striping and other signal modifications could lead to increasing the crossing and/or waiting times for pedestrians and bicyclists at intersections. Any impacts to the off-site pedestrian facilities are projected to be less than significant.

The Project is expected to generate demand for sidewalks to allow pedestrians to access nearby bus stops, the Caltrain station platforms, and adjacent land uses; sidewalks with a minimum width of 8 feet should be installed along all Project frontages. Pedestrian crossings internal to the Project site can be enhanced with high visibility crosswalks, corner bulbouts and signage. These improvements should meet ADA requirements and include direct travel paths from the southwest corner of California Street and Pacchetti Way to provide access to the Caltrain station. These impacts are potentially significant, given that the Project would not provide adequate pedestrian facilities to connect to the area circulation system.

Bicycle Facilities

The existing and planned bicycle facilities can accommodate the increased bicycle demand; therefore, the impact to bicycle facilities is less-than-significant and no mitigation measures are needed. No widening is currently proposed as part of intersection mitigation, although re-striping and other signal modifications could lead to increasing the crossing and/or waiting times for bicyclists at intersections. The project is required to provide 131 bicycle parking spaces.

Transit Facilities

The proposed project will generate additional demand for the existing transit services in the area, which can be accommodated by the existing transit capacity. Therefore, impacts to transit service are expected to be less-than-significant.

SITE ACCESS AND CIRCULATION

Access to the Project site will be provided via three driveways on San Antonio Road, three driveways on Pacchetti Way, and one driveway on California Street. The driveways on San Antonio Road and California Street are right-in, right-out only driveways, while the driveways on Pacchetti Way are full-access driveways. The internal circulation for the proposed parking areas were reviewed for issues related to queuing, safety, dead-end aisles, and parking spaces that may be difficult to maneuver in and out of.

All circulation aisles should accommodate two-way travel (most do) and all of the proposed parking spaces should be perpendicular (most are). Drive aisles should have a minimum width of 24 feet. The parking spaces nearest to the elevators in parking garages should be designated as the accessible spaces.

PARKING IMPACTS

The completed Project will provide a total of 2,559 parking spaces for employees and visitors, 89 of which will be accessible spaces. The proposed parking supply is 181 spaces, or 7 percent, below the City requirements. Some of the parking spaces could potentially be designated for complementary uses. With a 30 percent TDM goal, the office parking supply could potentially be reduced. With these allowances, the impact parking will have on the study area is less-than-significant. Without these allowances, the site plan should be revised to indicate the total number of spaces provided. The project applicant should consider adding a parking management program.

VEHICLE MILES TRAVELED (VMT) ESTIMATES

The City's travel demand forecasting (TDF) model was used to develop citywide daily VMT estimates for the Project. Total VMT generated by the Project was calculated using the Origin-Destination method. Total VMT is projected to increase by 36,120 vehicle-miles with the Project, or about 6.0 vehicle miles traveled per project trip.

TRANSPORTATION DEMAND MANAGEMENT PROGRAM

The City of Mountain View is requiring the Project to have a TDM program that reduces peak hour vehicle trips generated by the office space by approximately 30 percent. The TDM program needs to provide detailed descriptions of the variety of TDM strategies to be implemented on the site, the party responsible for each measure, the monitoring process, and penalties for non-compliance. Measures aimed at reducing both single-occupant vehicle trips and parking demand include subsidized transit tickets, alternative work schedules, bicycle and pedestrian "cash" payments, and parking "cash out" programs.

1. INTRODUCTION

This report presents the results of the transportation impact analysis (TIA) for Phase 2 of the proposed mixed-use development known as The Village at San Antonio Center located in the City of Mountain View, California. The project site is located south of California Street between San Antonio Road and Pacchetti Way. The project involves removing existing buildings and constructing the development. The development site's location near the San Antonio Caltrain station and the Transportation Demand Management (TDM) program for the office portion will reduce the number of vehicle trips it would generate. This chapter discusses the TIA purpose, project study area, analysis scenarios and methods, criteria used to identify significant impacts, and report organization.

PURPOSE

This analysis was conducted to identify potentially significant adverse impacts of the proposed project on the surrounding transportation system and to recommend measures to mitigate significant impacts for environmental clearance.

The proposed project will contain a 167-room hotel, 54,184 square feet of retail space, 392,853 square feet of office space, 28,502 square feet of flexible commercial space, 35,358 square feet of restaurant space, and a cinema with 1,710 seats. Access to the project site is provided via driveways on San Antonio Road, California Street, and Pacchetti Way. **Figure 1** shows the location of the project site, the surrounding transportation network, and study intersections and roadway segments. **Figure 2** presents the proposed ground level site plan.

This study addresses the project's impacts on the roadway system and the adjacent bicycle, pedestrian, and transit network. Project impacts were evaluated following the guidelines of the City of Mountain View and the Santa Clara Valley Transportation Authority (VTA), the congestion management agency for Santa Clara County.

PROJECT STUDY AREA

STUDY INTERSECTIONS

Project impacts on the study area roadway facilities were determined by measuring the effect project traffic would have on intersection operations during the morning (7:00 to 9:00 AM) and evening (4:00 to

6:00 PM) peak periods. A total of 27 intersections were selected in consultation with City staff as study locations. These locations were chosen based on VTA's TIA Guidelines, (March 2009), which indicate that intersections should be included if the proposed project adds 10 or more peak hour vehicles per lane to any intersection movement. Intersections that are part of the Santa Clara County Congestion Management Program (CMP) or are designated by the City of Mountain View *2030 General Plan* (2012) as within the San Antonio Center Planning Area are also identified. The study intersections and their jurisdictions are:

1. San Antonio Road and US 101 Northbound Off-Ramp (MV)
2. San Antonio Road and Charleston Road (PA)*
3. San Antonio Road and Middlefield Road (PA)*
4. San Antonio Road and California Street (MV)**
5. San Antonio Road and Fayette Drive (MV)**
6. San Antonio Road and El Camino Real (MV)*
7. San Antonio Road and W. Portola Avenue (LA)
8. San Antonio Road and Almond Avenue (LA)
9. San Antonio Road and W. Edith Avenue / Main Street (LA)
10. San Antonio Road and Cuesta Drive / First Street (LA)
11. El Camino Real and Los Robles Avenue / El Camino Way (PA)
12. El Camino Real and Maybell Avenue (PA)
13. El Camino Real and Arastradero Road / Charleston Road (PA)
14. El Camino Real and Los Altos Avenue / Cezano Court (LA)
15. El Camino Real and Del Medio Avenue (MV)
16. El Camino Real and Showers Drive (MV)
17. El Camino Real and Ortega Avenue (MV)
18. El Camino Real and Rengstorff Avenue (MV)*
19. California Street and Del Medio Avenue (MV)**
20. California Street and Pacchetti Way (MV)**
21. California Street and Showers Drive (MV)**
22. California Street and Ortega Avenue (MV)**
23. California Street and Rengstorff Avenue (MV)**
24. Latham Street and Showers Drive (MV)**
25. El Camino Real and El Monte Avenue (MV)*
26. El Camino Real and Shoreline Boulevard (MV)*
27. El Camino Real and Castro Street (MV)*

LA = Los Altos
** = CMP intersection*

MV = Mountain View
*** = San Antonio Center Planning Area*

PA = Palo Alto

FREEWAY SEGMENTS

The study freeway segments were selected in consultation with the City of Mountain View and finalized based on VTA guidelines. The analysis evaluated the operations of the following freeway segments in both the northbound and southbound directions:

- US 101 from Oregon Expressway to San Antonio Road
- US 101 from San Antonio Road to Rengstorff Avenue
- US 101 from Rengstorff Avenue to North Shoreline Boulevard

ANALYSIS SCENARIOS

The operations of the study intersections were evaluated during the weekday morning (AM) and weekday evening (PM) peak hours for the following six scenarios:

- Scenario 1:** *Existing Conditions* - Existing volumes obtained from counts.
- Scenario 2:** *Existing Plus Project Conditions* - Scenario 1 volumes plus traffic generated by the proposed project.
- Scenario 3:** *Background Conditions* - Existing volumes plus traffic from approved but not yet constructed developments in the area.
- Scenario 4:** *Background Plus Project Conditions* - Scenario 3 volumes plus traffic generated by the proposed project.
- Scenario 5:** *Cumulative Near-Term Conditions* – Existing volumes from Scenario 1 plus a growth factor accounting for general growth in the area, as well as traffic from approved but not yet constructed developments in the area. The growth factor is 2 percent per year on the existing volumes, taken from 2013 to 2017 (4 years).
- Scenario 6:** *Cumulative Near-Term Plus Project Conditions* - Scenario 5 volumes plus traffic generated by the proposed project.

TRAFFIC ANALYSIS METHODS

The operations of roadway facilities are described with the term level of service (“LOS”, a qualitative description of traffic flow based on such factors as speed, travel time, delay, and freedom to maneuver). Six levels are defined from LOS A, as the best operating conditions, to LOS F, or the worst operating conditions. LOS E represents “at-capacity” operations. When traffic volumes exceed the intersection capacity, stop-and-go conditions result, and operations are designated as LOS F.

SIGNALIZED INTERSECTIONS

The level of service method approved by the VTA and adopted by the Cities of Mountain View, Palo Alto, and Los Altos for signalized intersections is the method described in Chapter 16 of the *2000 Highway Capacity Manual* (HCM) (Special Report 209, Transportation Research Board) with adjusted saturation flow rates to

reflect conditions in Santa Clara County. This method bases signalized intersection operations on the average control vehicular delay.

Control delay includes initial deceleration delay, queue move-up time, stopped delay, and acceleration delay. The average control delay for signalized intersections is calculated using Traffix analysis software and is correlated to a LOS designation as shown in **Table 1**. The Cities of Mountain View, Palo Alto, and Los Altos use a LOS D standard for local street intersections and LOS E standard for CMP facilities and, for the City of Mountain View, intersections within the Downtown and San Antonio Center Planning Areas.

TABLE 1: SIGNALIZED INTERSECTION LEVEL OF SERVICE DEFINITIONS

Level of Service	Description	Average Control Delay per Vehicle (seconds)
A	Operations with very low delay occurring with favorable progression and/or short cycle lengths.	≤ 10.0
B+	Operations with low delay occurring with good progression and/or short cycle lengths.	10.1 to 12.0
B		12.1 to 18.0
B-		18.1 to 20.0
C+	Operations with average delays resulting from fair progression and/or longer cycle lengths. Individual cycle failures begin to appear.	20.1 to 23.0
C		23.1 to 32.0
C-		32.1 to 35.0
D+	Operations with longer delays due to a combination of unfavorable progression, long cycle lengths, and high volume-to-capacity (V/C) ratios. Many vehicles stop and individual cycle failures are noticeable.	35.1 to 39.0
D		39.1 to 51.0
D-		51.1 to 55.0
E+	Operations with high delay values indicating poor progression, long cycle lengths, and high V/C ratios. Individual cycle failures are frequent occurrences.	55.1 to 60.0
E		60.1 to 75.0
E-		75.1 to 80.0
F	Operations with delays unacceptable to most drivers occurring due to over-saturation, poor progression, or very long cycle lengths.	> 80.0

Source: *Traffic Level of Service Analysis Guidelines*, VTA Congestion Management Program, June 2003; *Highway Capacity Manual*, Transportation Research Board, 2000.

UNSIGNALIZED INTERSECTIONS

Operations of the unsignalized study intersections (e.g., stop-sign controlled) were evaluated using the methods contained in Chapter 17 of the *2000 HCM* and calculated using the Traffix analysis software. LOS ratings for stop-sign controlled intersections are based on the average control delay expressed in seconds per vehicle. At two-way or side-street-stop controlled intersections, control delay is calculated for each movement, not for the intersection as a whole. For approaches composed of a single lane, control delay is computed as the average of all movements in that lane. For all-way stop-controlled locations, a weighted

average delay for the entire intersection is presented. **Table 2** summarizes the relationship between delay and LOS for unsignalized intersections. The City does not have an adopted LOS policy for unsignalized intersections; however, LOS D is considered to be the minimum acceptable LOS and has been used for traffic studies within the City.

TABLE 2: UNSIGNALIZED INTERSECTION LEVEL OF SERVICE DEFINITIONS

Level of Service	Description	Average Control Delay Per Vehicle (Seconds)
A	Little or no delay.	≤ 10.0
B	Short traffic delays.	10.1 to 15.0
C	Average traffic delays.	15.1 to 25.0
D	Long traffic delays.	25.1 to 35.0
E	Very long traffic delays.	35.1 to 50.0
F	Extreme traffic delays with intersection capacity exceeded.	> 50.0

Source: *Highway Capacity Manual*, Transportation Research Board, 2000.

FREEWAY SEGMENTS

Freeway segments within Santa Clara County were are evaluated using VTA analysis procedure, which is based on the density of the traffic flow using methods described in the *2000 HCM*. Density is expressed in passenger cars per mile per lane. The Congestion Management Program ranges of densities for freeway segment levels of service are shown in **Table 3**. The VTA standard for the freeway segments is LOS E.

TABLE 3: FREEWAY SEGMENT LEVEL OF SERVICE DEFINITIONS

Level of Service	Density (passenger cars per mile per lane)
A	≤ 11
B	11.1 to 18.0
C	18.1 to 26.0
D	26.1 to 46.0
E	46.1 to 58.0
F	> 58.0

Source: *Traffic Level of Service Analysis Guidelines*, VTA Congestion Management Program, June 2003;
Highway Capacity Manual, Transportation Research Board, 2000.

SIGNIFICANT IMPACT CRITERIA

The determination of significance for project impacts is based on applicable policies, regulations, goals, and guidelines defined by the Cities of Mountain View, Los Altos, and Palo Alto and the VTA. The impacts of the project were evaluated by comparing the results of the level of service calculations under Existing Plus Project Conditions and Background Plus Project Conditions to the results under Existing Conditions and Background Conditions, respectively. A similar comparison under Cumulative Near-Term Conditions was done to identify cumulative impacts. The detailed impact criteria for this study are presented below.

SIGNALIZED INTERSECTIONS IN THE CITIES OF MOUNTAIN VIEW, LOS ALTOS, AND PALO ALTO

The three cities containing the study intersections use the same significant impact criteria for signalized intersections. Significant impacts at signalized intersections are defined to occur when the addition of project traffic causes one of the following:

- Intersection operations to degrade from an acceptable level to an unacceptable level; or
- Exacerbate unacceptable operations by increasing the critical delay by more than four seconds and increasing the volume-to-capacity (V/C) ratio by 0.01 or more; or
- An increase in the V/C ratio of 0.01 or more at an intersection with unacceptable operations when the change in critical delay is negative (i.e., decreases). This can occur if the critical movements change.

The City of Mountain View uses a LOS D standard for local street intersections and LOS E standard for intersections within the Downtown and San Antonio Center areas and CMP facilities. The level of service standard defined as acceptable by the City of Los Altos *General Plan Circulation Element* (November, 2002) is LOS D or better for City controlled intersections. The City of Palo Alto uses the same level of service standard.

UNSIGNALIZED INTERSECTIONS

Levels of service analysis at unsignalized intersections are generally used to determine the need for modification in type of intersection control (i.e. all-way stop or signalization). As part of this evaluation traffic volumes, delay, and traffic signal warrants are evaluated to determine if the existing intersection control is appropriate.

The Cities of Mountain View, Los Altos, and Palo Alto do not have an officially adopted significance criteria for unsignalized intersections. Based on previous studies in these cities, significant impacts are defined to occur when the addition of project traffic causes the average intersection delay for all-way stop-controlled

intersection or the worst movement/approach for side-street stop-controlled intersections to degrade to LOS F and the intersection satisfies the peak hour traffic signal warrant from the *California Manual of Uniform Traffic Control Devices (MUTCD)*.

SANTA CLARA COUNTY AND CMP INTERSECTIONS

The LOS standard for Santa Clara County-operated intersections is LOS E. The LOS standard for CMP intersections is LOS E. The City of Mountain View uses its LOS D threshold for CMP intersections, except those in the Downtown and San Antonio Planning Area where the threshold is LOS E. Traffic impacts these intersections would occur when the addition of traffic associated with a project causes:

- Intersection operations to deteriorate from an acceptable level (LOS E or better) to an unacceptable level (LOS F); or
- Exacerbate unacceptable operations by increasing the average critical delay by more than 4 seconds and increasing the critical volume-to-capacity (V/C) ratio by 0.01 or more at an intersection operating at LOS F; or
- The V/C ratio increases by 0.01 or more at an intersection with unacceptable operations (LOS F) when the change in critical delay is negative (i.e., decreases). This can occur if the critical movements change.

PEDESTRIAN AND BICYCLE IMPACT CRITERIA

The City of Mountain View *2030 General Plan* describes related policies necessary to ensure that pedestrian and bicycle facilities are safe and effective for City residents. Using the *General Plan* as a guide, significant impacts to these facilities would occur when a project or an element of the project:

- Would not provide adequate pedestrian and bicycle facilities to connect to the area circulation system;
- Conflicts with existing or planned bicycle or pedestrian facilities without adequate design and/or appropriate warning systems; or
- Has a design that would cause increased potential for bicycle/vehicle conflicts;
- Generates vehicles that would cross pedestrian facilities on a regular basis without adequate design and/or warning systems, causing safety hazards.

TRANSIT IMPACT CRITERIA

Significant impacts to transit service would occur if the project or any part of the project:

- Creates demand for public transit services above the capacity which is provided, or planned;

- Or project-related mitigation disrupts existing transit services or facilities¹; or
- Conflicts with an existing or planned transit facility; or
- Conflicts with transit policies adopted by the Cities of Mountain View, Los Altos, and Palo Alto, Santa Clara County, VTA, or the California Department of Transportation (Caltrans) for their respective facilities in the study area.

FREEWAY SIGNIFICANCE IMPACT CRITERIA

Traffic impacts on CMP freeway segments in Santa Clara County are determined to occur when the addition of project traffic causes:

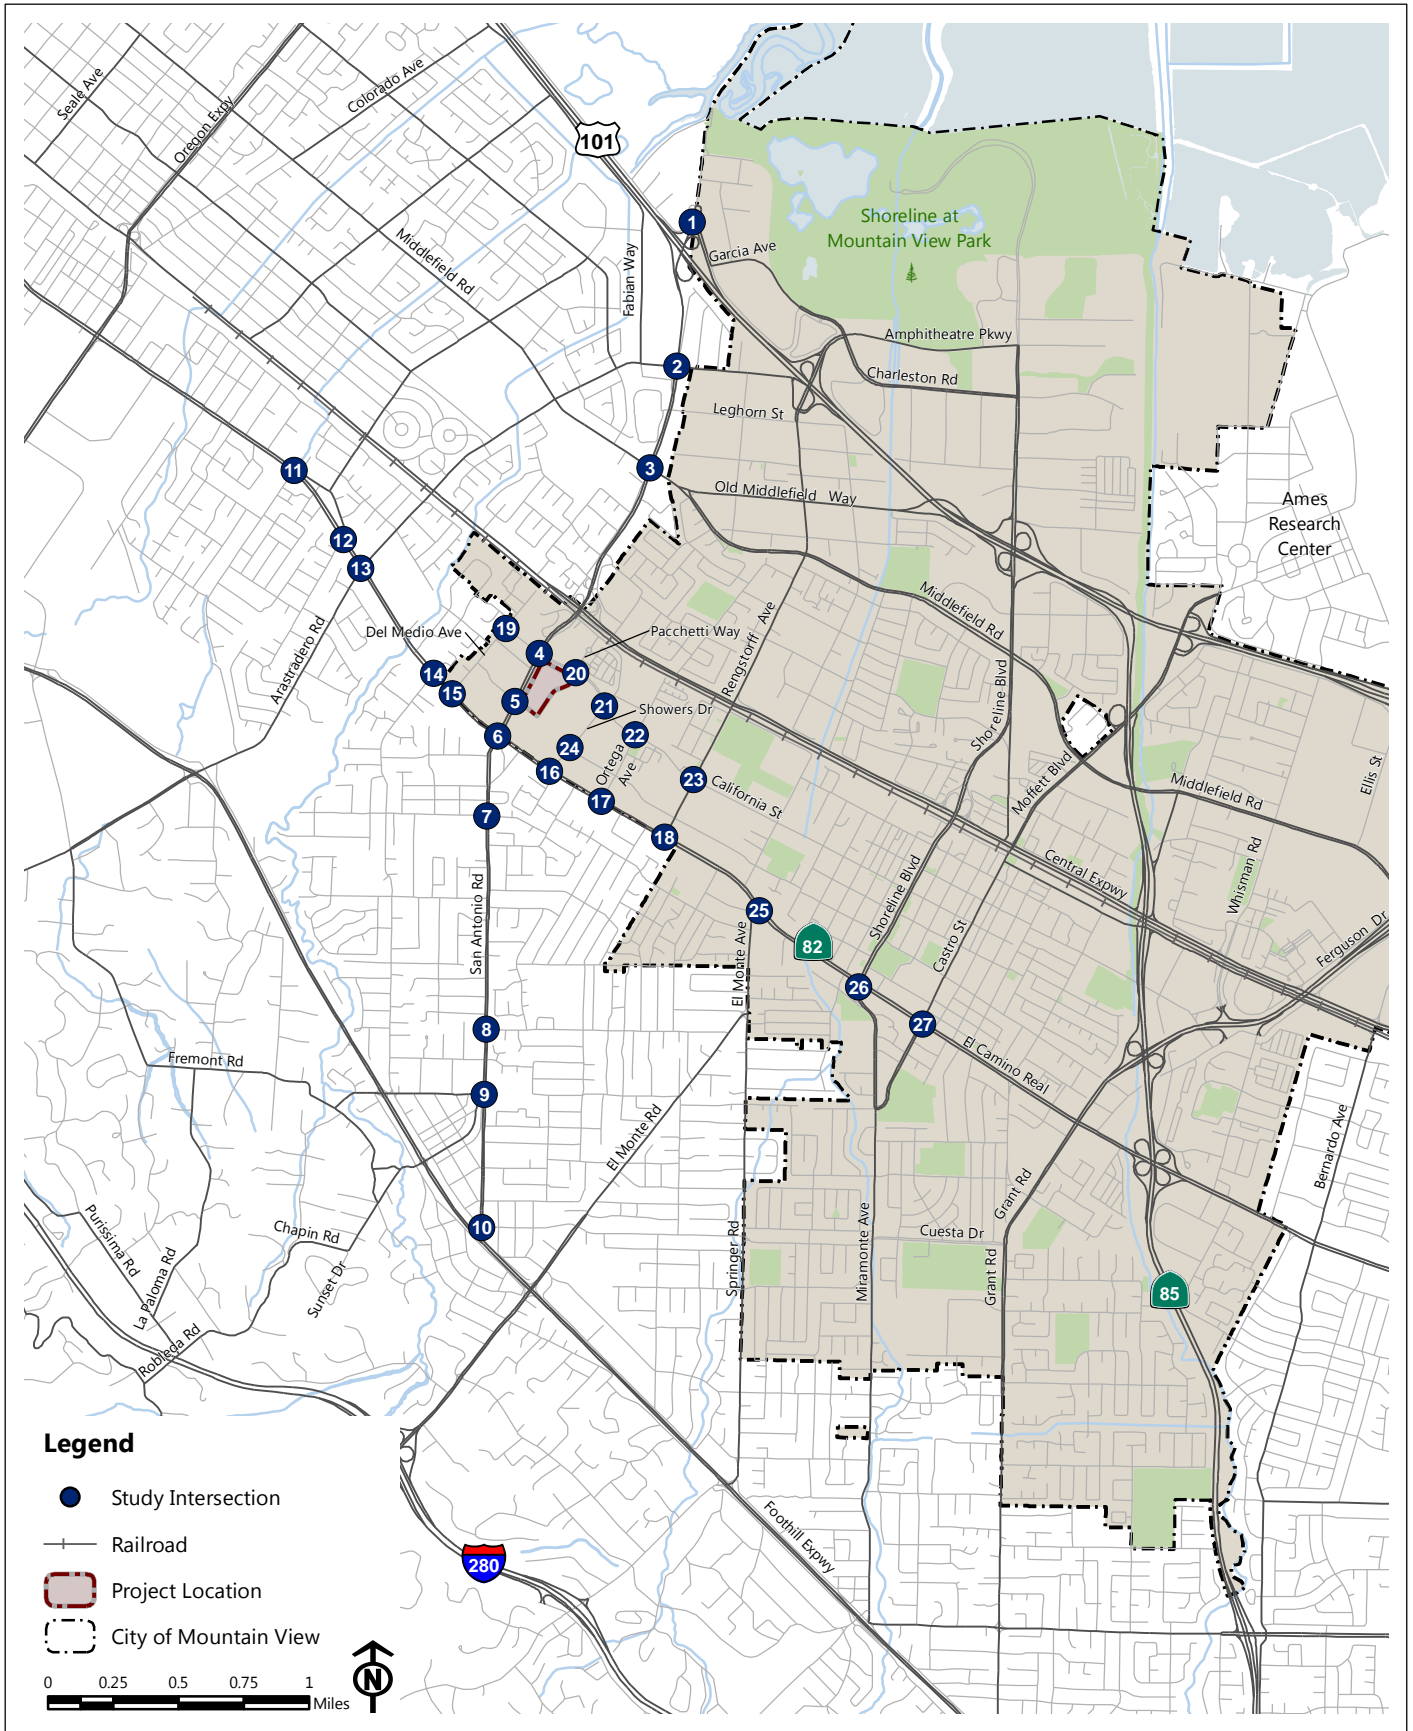

- Freeway segment operations to deteriorate from an acceptable level (LOS E or better) under the Existing Conditions to an unacceptable level (LOS F); or
- An increase in traffic of more than one percent of the capacity of the segments that operate at LOS F under Existing Conditions.

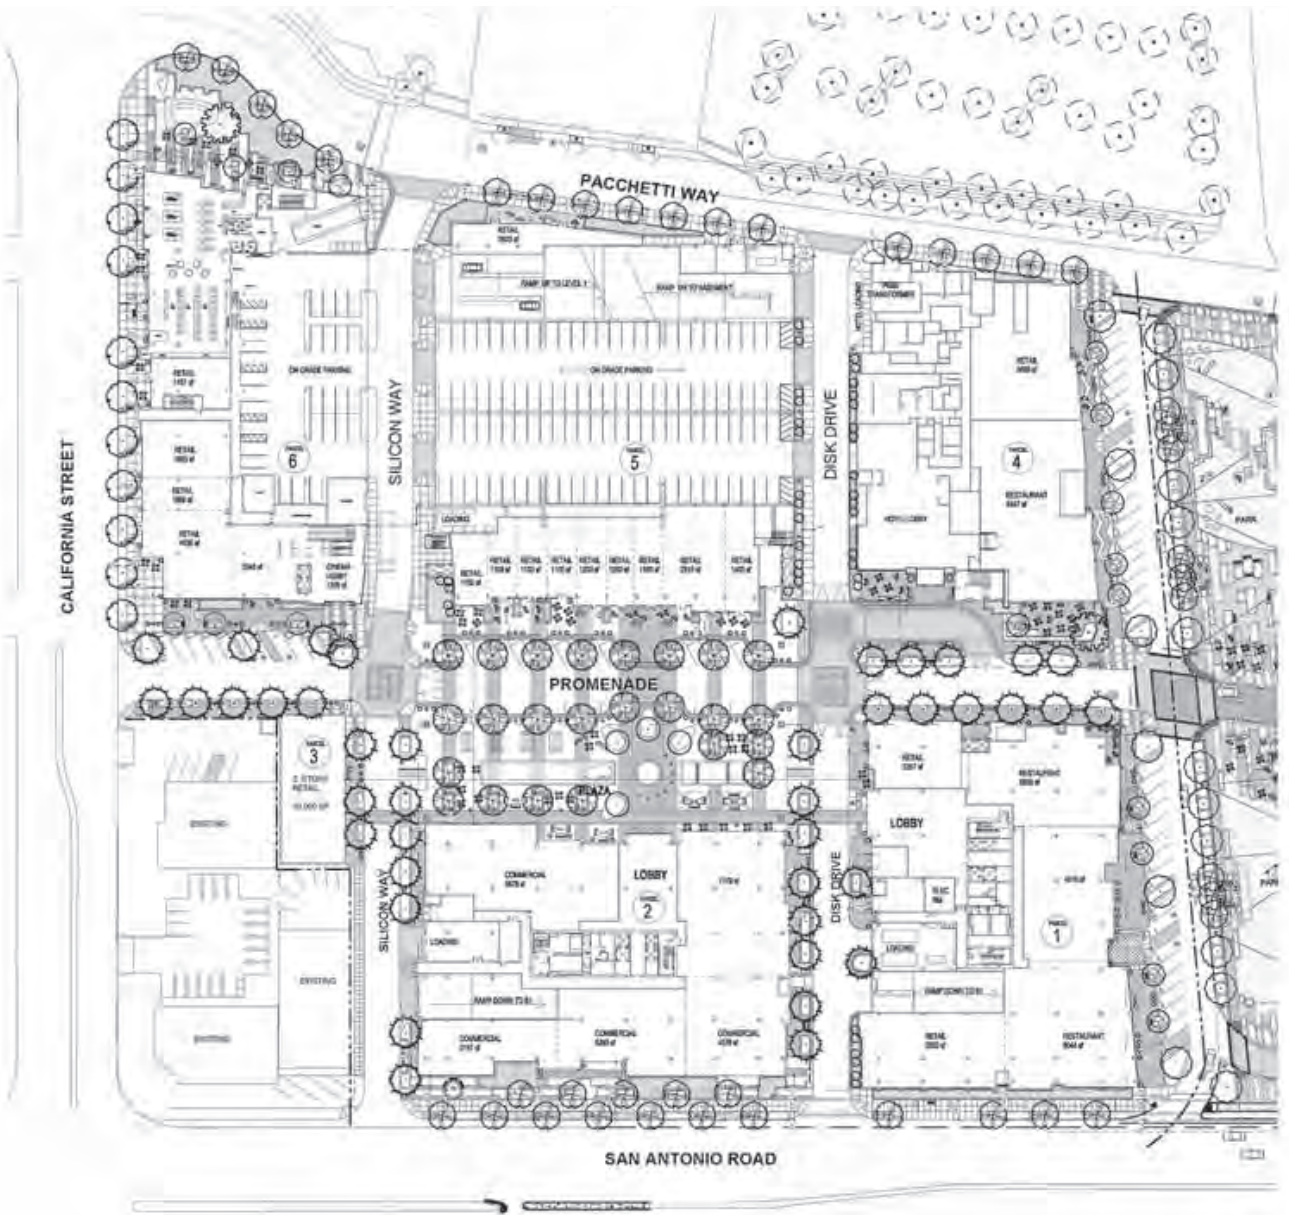

¹ This includes disruptions caused by proposed-project driveways on transit streets and impacts to transit stops/shelters; and impacts to transit operations from traffic improvements proposed or resulting from a project.

REPORT ORGANIZATION

This report is divided into chapters as described below:

- **Chapter 2 – Existing Conditions** describes the transportation system near the project site, including the surrounding roadway network, morning and evening peak period intersection turning movement volumes, existing bicycle, pedestrian, and transit facilities, intersection levels of service, and freeway segment levels of service.
- **Chapter 3 – Project Transportation Characteristics** describes the land use components of the project and the method used to estimate the amount of traffic and transit ridership generated by it. The distribution and assignment of vehicle traffic on the roadway system is also discussed in this chapter.
- **Chapter 4 – Existing Plus Project Conditions** addresses the Existing Plus Project Conditions, including intersection levels of service, and freeway segment levels of service.
- **Chapter 5 – Background Traffic Conditions** addresses the conditions with approved, but not yet constructed, projects. The chapter discusses these conditions, both without and with the project, and discusses project vehicular impacts.
- **Chapter 6 – Cumulative Near-Term Traffic Conditions** addresses near-term cumulative conditions, which include a growth factor to account for general growth in the area. The analysis is done both without and with the project, and there is a discussion of cumulative project vehicular impacts.
- **Chapter 7 – Site Access, Circulation and Parking** describes project access and circulation for all travel modes, and discusses project vehicular, pedestrian, bicycle, and transit impacts.
- **Chapter 8 – VMT Estimates** presented estimates of vehicle miles traveled (VMT) due to the project to be used in the greenhouse gas emissions analysis.

Drawing Source:

2. EXISTING CONDITIONS

This chapter describes the Existing Conditions of the roadway facilities, pedestrian, and bicycle facilities, and transit service near the project site. It also presents existing traffic volumes, pedestrian and bicycle volumes, and operations for the study intersections and freeway segments with the results of level of service calculations.

EXISTING STREET SYSTEM

US 101 provides regional access to the project site. The following streets provide local access: San Antonio Road, Middlefield Road, Alma Street/Central Expressway, California Street, Latham Street, El Camino Real, Rengstorff Avenue, Showers Drive, Del Medio Avenue, Los Altos Avenue, and Charleston Road/Arastradero Road. Each access facility is described below in more detail. Figure 1 shows the locations of these facilities in relation to the project site.

US 101 is a primarily north-south freeway and is located northeast of the project site providing four travel lanes in each direction. One travel lane in each direction is designated as a high-occupancy vehicle (HOV) lane. HOV lanes, also known as diamond or carpool lanes, are limited to use by vehicles occupied by two or more persons Monday through Friday between 5:00 AM and 9:00 AM, and between 3:00 PM and 7:00 PM. US 101 extends north through San Francisco and south through San Jose. Access to the site from US 101 is provided via interchanges with San Antonio Road and Rengstorff Avenue.

San Antonio Road is a four to six-lane, east-west Flexible Street that extends east towards US 101 and west towards Los Altos, as classified by the Mountain View General Plan (2012). San Antonio Road has four lanes with the exception of a six-lane segment between El Camino Real and California Street (adjacent to the project site). San Antonio Road provides direct access to the western portion of the project site. San Antonio Road has raised medians, some with landscaping, near the project site and Class II bike lanes in both directions west of El Camino Real. The posted speed limit is 35 mph near the project site.

Middlefield Road is a four-lane, north-south Avenue that extends south towards Sunnyvale and north towards Palo Alto, Menlo Park, and Redwood City. Near the project site between Rengstorff Avenue and Old Middlefield Way, traffic is divided by a raised median with trees and enhanced landscaping. On-street parking is provided on both sides of Middlefield Road between Charleston Road and Old Middlefield Way. Middlefield Road has Class II bike lanes in both directions between Charleston Road and Montrose Avenue and between Old Middlefield Way and Rengstorff Avenue near the project site. The posted speed limit is 35 mph between

Rengstorff Avenue and Old Middlefield Way and 25 mph between Middlefield Way and Charleston Road near the project site.

Alma Street/Central Expressway is a four-lane, north-south Expressway that extends south towards Sunnyvale and Santa Clara and north towards Palo Alto. The expressway is named the Central Expressway south of the San Antonio Road interchange, while north of the interchange it is named Alma Street. Central Expressway divides traffic with a raised, landscaped median, while Alma Street has a two-way left turn median. The posted speed limit is 45 mph on the Central Expressway and 35 mph on Alma Street near the project site.

California Street is a two to four-lane, north-south Residential Collector that extends south towards Mountain View and north to Del Medio Avenue. California Street has four lanes south of San Antonio Road and two lanes north of San Antonio Road, providing direct access to the northern border of the project site. In addition, north of San Antonio Road, free on-street parking is provided on both sides of the street. Between San Antonio Road and Showers Drive, California Street has a raised, landscaped median with trees. Near the project site between Del Medio Avenue and Rengstorff Avenue, California Street has Class II bike lanes in both directions. The posted speed limit is 35 mph near the project site.

Latham Street is a two-lane, north-south Residential Collector that extends from Showers Drive in the north to Shoreline Boulevard in the south. Latham Street's northern terminus at Showers Drive provides direct access to the San Antonio Transit Center. Near the project site, Latham Street provides free on-street parking in both directions. The posted speed limit is 25 mph near the project site.

El Camino Real is a six-lane, north-south Boulevard (also State Route (SR) 82) that extends south towards Mountain View and Santa Clara and north towards Redwood City, Millbrae, and San Bruno. El Camino Real provides access to local and regional commercial areas and access to the project site via San Antonio Road. Near the project site, El Camino Real has a raised, landscaped median and provides on-street parking on both sides of the street. The posted speed limit is 35 mph near the project site. Near the project site, El Camino Real is designated as a Terminal Access route by Caltrans under the federal Surface Transportation Assistance Act of 1982 (STAA).

Rengstorff Avenue is a four-lane, east-west Avenue that extends east towards US 101 (and the Google campus) and west towards El Camino Real, where it terminates. Rengstorff Avenue provides regional access to the project site via its connection to US 101 and California Street and El Camino Real. Rengstorff Avenue has Class II bike lanes in both directions near the project site, as well as raised, landscaped medians near its intersections with California Street and the Central Expressway. Rengstorff Avenue provides on-street parking in both directions, with more limited parking areas west of California Street. The posted speed limit is 35 mph near the project site.

Showers Drive is a two to four-lane, east-west Flexible Street that extends east towards the San Antonio Caltrain Station and west towards El Camino Real, its western terminus. Showers Drive has two lanes east of California Street and four lanes west of California Street. Showers Drive provides access to the project site via California Street and El Camino Real and direct access to the San Antonio Transit Center. Showers Drive has Class II bike lanes in both directions near the project site. It also has several raised, landscaped medians east of California Street and a two-way left turn lane median west of California Street. The posted speed limit is 35 mph near the project site.

Del Medio Avenue is a two-lane, east-west Residential Street that extends east towards the Caltrain right of way – its eastern terminus – and west towards El Camino Real, its western terminus. Del Medio Avenue provides access to the project site via California Street, Miller Avenue, Fayette Drive, and El Camino Real. Free on-street parking is provided on both sides of the streets. A short segment of Del Medio Avenue between California Street and Miller Avenue is classified as a Class III bike route. The posted speed limit is 25 mph near the project site.

Los Altos Avenue is a two-lane local street that extends east to El Camino Real – its eastern terminus – and west towards Los Altos. Los Altos Avenue provides access to the project site via El Camino Real and has Class II bike lanes. The posted speed limit is 25 mph near the project site.

Charleston Road/Arastradero Road is a two to four-lane, east-west Avenue that extends east towards US 101 and west towards Interstate 280. The street is named Charleston Road east of El Camino Real and Arastradero Road west of El Camino Real. Charleston Road is a two-lane road with the exception of a four-lane segment between Alma Street and El Camino Real. Charleston Road has painted center medians with some left turn pockets, while Arastradero Road has a two-way left turn median. Both Charleston Road and Arastradero Road have Class II bike lanes. The posted speed limit is 25 mph near the project site.

EXISTING PEDESTRIAN FACILITIES

Pedestrian facilities consist of sidewalks, crosswalks, and pedestrian signals at signalized intersections. Most of the streets near the project have sidewalks on both sides of the street, with some exceptions on San Antonio Road and Alma Street/Central Expressway. Along San Antonio Road and California Street near the project site, sidewalks are four to six feet wide, generally in good condition, and free from obstructions (such as telephone poles).

Most signalized intersections within one-quarter mile of the project site have crosswalks and pedestrian signals on all four legs. In addition, there is a mid-block, unsignalized crosswalk at Miller Avenue that crosses San Antonio Road near the intersection of San Antonio Road and California Street.

The project site is within walking distance of the San Antonio Caltrain Station, located north of the site and accessible via Pacchetti Way or San Antonio Road and San Antonio Circle. **Figure 3** presents the pedestrian routes to the Caltrain station platform from the Project site.

EXISTING BICYCLE FACILITIES

Bikeway planning and design in California typically relies on guidelines and design standards established by Caltrans in the *Highway Design Manual* (Chapter 1000: Bikeway Planning and Design) and other design documents. Bicycle facilities comprise paths (Class I), lanes (Class II), routes (Class III), and boulevards (Class IIIA) as described below and shown on the accompanying figures.

- Class I Bikeway (Bicycle Path) provides a completely separate right-of-way and is designated for the exclusive use of bicycles and pedestrians with vehicle and pedestrian cross-flow minimized.

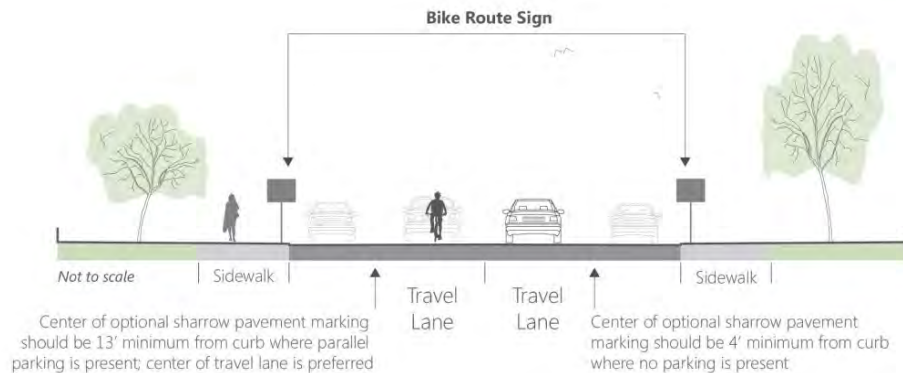

- Class II Bikeway (Bicycle Lane) provides a restricted right-of-way and is designated for the use of bicycles with a striped lane on a street or highway. Bicycle lanes are generally four to six feet wide. Adjacent vehicle parking and vehicle/pedestrian cross-flow are permitted.

- Class III Bikeway (Bicycle Route) provides for a right-of-way designated by signs or pavement markings (sharrows) for shared use with pedestrians or motor vehicles. Sharrows are a type of pavement marking

(bike and arrow stencil) placed to guide bicyclists to the best place to ride on the road, avoid car doors, and remind drivers to share the road with cyclists.

- Class IIIA Bikeway (Bicycle Boulevard) is a modified bicycle route providing convenient and efficient through route for cycles of all skill levels. A bike boulevard includes signage, pavement markings, and in some cases, traffic calming (e.g., mid-block closures to vehicles), and bike lanes.

CITY OF MOUNTAIN VIEW BICYCLE TRANSPORTATION PLAN

For local reference, the *City of Mountain View Bicycle Transportation Plan* (May 2008) provides an assessment of current conditions as well as planned improvements to the bike network. **Figure 4** presents existing bicycle facilities within a ½-mile ride of the project site. These facilities include:

- Bicycle lanes on:
 - Middlefield Road between Charleston Road and Montrose Avenue
 - Middlefield Road between Old Middlefield Way and Rengstorff Avenue
 - California Street between Del Medio Avenue and Castro Street
 - Rengstorff Avenue between El Camino Real and Garcia Avenue
 - Showers Drive between El Camino Real and Pacchetti Way
 - San Antonio Road between Foothill Expressway and El Camino Real
 - Arastradero Road between Foothill Expressway and El Camino Real
 - Charleston Road between El Camino Real and Fabian Way
- Bicycle routes on:
 - Del Medio Avenue between California Street and Miller Avenue

SAN ANTONIO ROAD BICYCLE LANES

In 2013, the City of Mountain View Public Works Department submitted a road improvement project to the 2012-2013 Capital Improvement Program that will provide Class II bike lanes along San Antonio Road from El Camino Real to California Street. The scope of the project also includes removal and replacement of curbs,

gutters, sidewalks, driveways, wheelchair ramps, median islands, traffic signal loop detectors, street trees, and roadway striping, as well as relocation of electroliers, roadway signs, traffic signals, storm drain inlets and fire hydrants with the construction of a park strip with street trees.

SANTA CLARA COUNTYWIDE BICYCLE PLAN

The Santa Clara Countywide Bicycle Plan synthesizes other local and County plans into a comprehensive 20-year cross-county bicycle corridor network and expenditure plan (May 2008). The long-range countywide transportation plan and the means by which projects compete for funding and prioritization are documented in the Valley Transportation Plan (VTP) 2035 (adopted in January 2009). VTA has adopted the Santa Clara Countywide Bicycle Plan (CBP, May 2008), which is a planned bicycle network of 16 routes of countywide or intercity significance. Several of these proposed facilities travel through the study area, including (listing street with cross county bicycle corridor number and name):

- California Street (#2 Alma Street/Caltrain Corridor)
- El Camino Real (#4 El Camino Real – Grand Boulevard Corridor)
- El Camino Real / San Antonio Road (#5C San Antonio/Arastradero Alignment)

BAY AREA BIKE SHARE

The Bay Area Bike Share is the region's bike sharing system with 700 bikes and 70 stations across the region launching in August 2013, with locations in San Francisco, Redwood City, Mountain View, Palo Alto, and San Jose. It is intended to provide Bay Area residents and visitors with an additional transportation option for getting around the region. Bay Area bikes can be rented from and returned to any station in the system, creating a network with many possible combinations of start and end point.

Mountain View will have seven Bike Share stations; four in the Downtown area and three near the project site at the following locations:

- San Antonio Caltrain Station
- San Antonio Shopping Center (Latham Street at Showers Drive)
- Rengstorff at California

PEDESTRIAN AND BICYCLE OBSERVATIONS

Pedestrian activity varied by intersection, with the greatest numbers observed near the Caltrain station, along San Antonio Road, and California Street. The intersections of San Antonio Road and California Street and

Pacchetti Way and California Street experience high pedestrian activity as Caltrain commuters walk to and from nearby uses. These intersections serve approximately 40 to 50 pedestrians during both the AM and PM peak hours. The intersection of El Camino Real and San Antonio Road also serves high pedestrian activity during the morning and evening peak hours.

Bicycle use is widespread throughout the study area and is consistent with pedestrian activity, with the greatest numbers observed along California Avenue near the project site. Bicycle lanes are provided California Street near the project site. **Figure 5** presents the existing peak hour bicycle and pedestrian volumes.

EXISTING TRANSIT SERVICE

Bus service in Mountain View is operated by the VTA. Commuter rail service (Caltrain) is provided from San Francisco to Gilroy by the Peninsula Joint Powers Board. **Figure 6** shows the existing transit service near the project site. The project site is served by VTA local, express and rapid transit routes, Caltrain, and the Stanford Marguerite Shuttle. **Table 4** describes the span of services and frequency of service during the week with average weekday load factors for VTA buses and Caltrain.

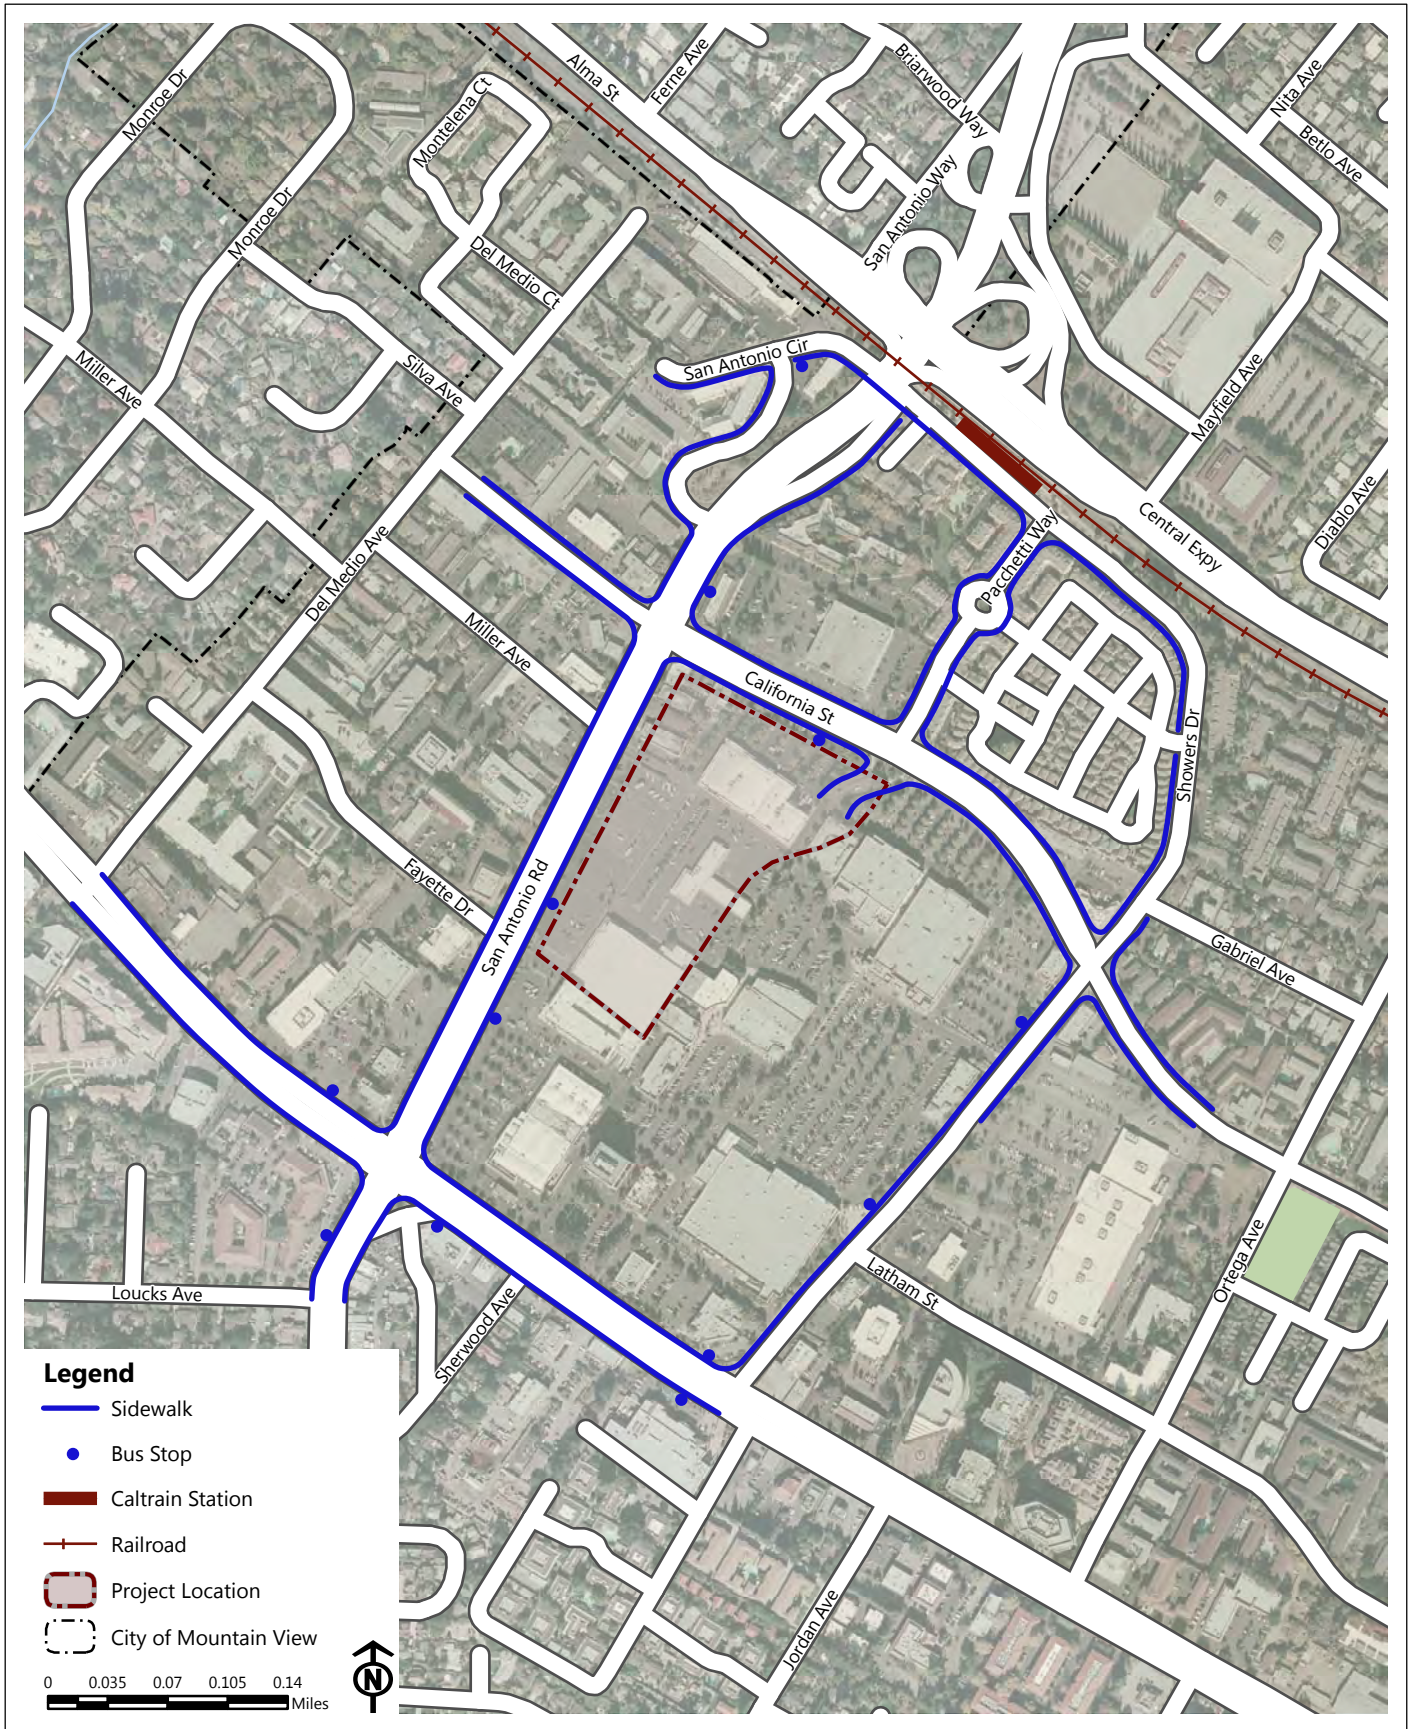

TABLE 4: EXISTING TRANSIT SERVICES

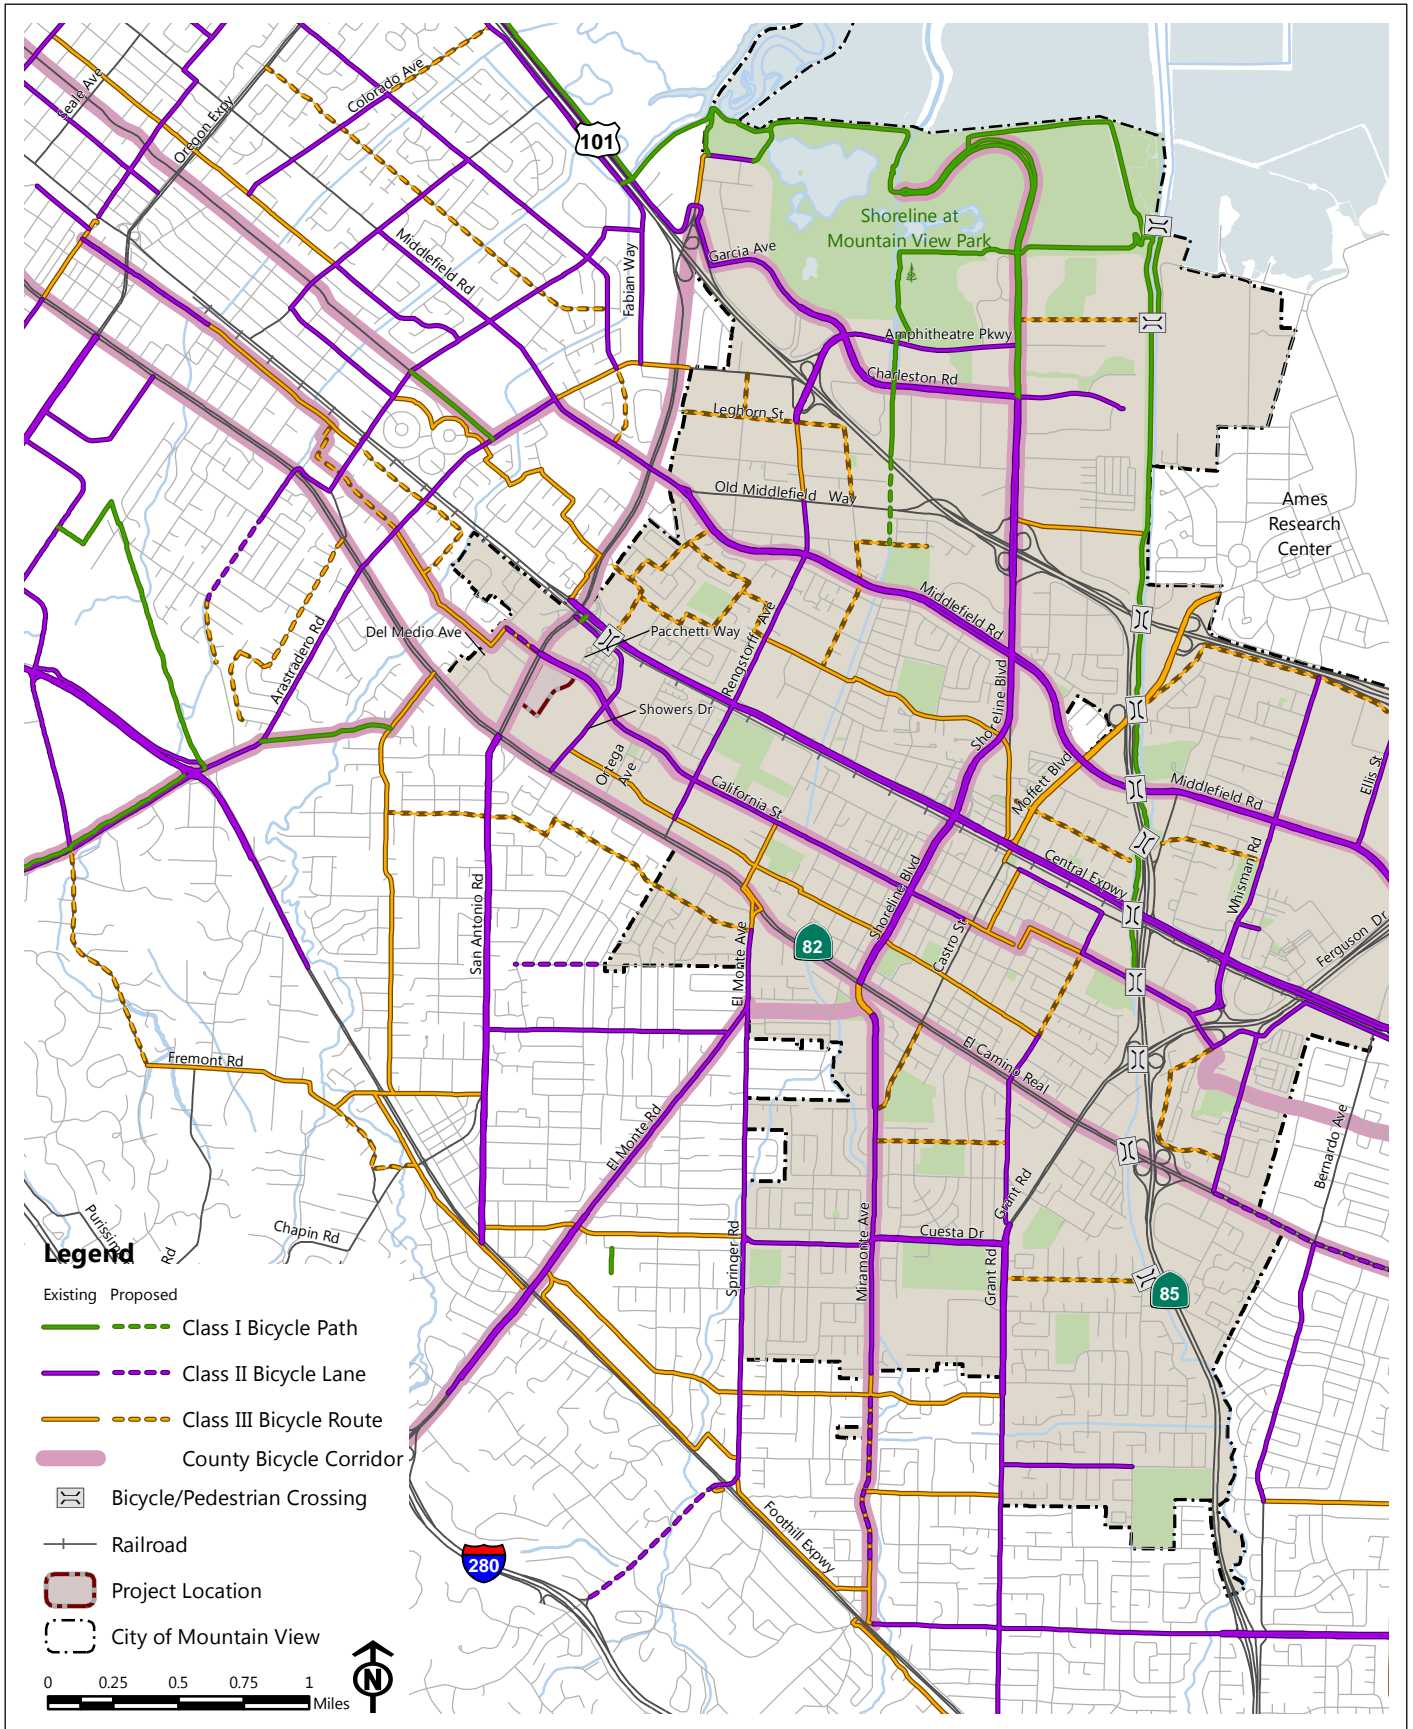

Route ¹	From	To	Weekdays		Weekends		Peak Load Factor ³
			Operating Hours	Peak Headway ²	Operating Hours	Headway ²	
VTA							
22	Palo Alto Transit Center	Eastridge Transit Center	24-hour service	12	24-hour service	15	0.82 ⁴
32	San Antonio Transit Center	Santa Clara Transit Center	5:45 AM - 8:00 PM	30	8:50 AM – 5:50 PM (Sat only)	60	0.54 ⁴
34	San Antonio Transit Center	Mountain View	9:50 AM - 3:00 PM	60	No service	No service	0.12 ⁴
35	Mountain View	Stanford Shopping Center	5:50 AM - 10:40 PM	30	8:30 AM - 8:10 PM	60	0.56 ⁴

Caltrain							
Caltrain San Antonio Station	San Francisco	Gilroy	4:30 AM - 1:32 AM	20-40	7:00 AM - 1:40 AM	60	0.88 ⁵
Stanford Marguerite Shuttle System							
Shopping Express (SE)	Palo Alto Transit Center	San Antonio Shopping Center	3:00 PM - 10:20 PM	50 (evening only)	9:45 AM- 10:30 PM	45	0.35 ⁶

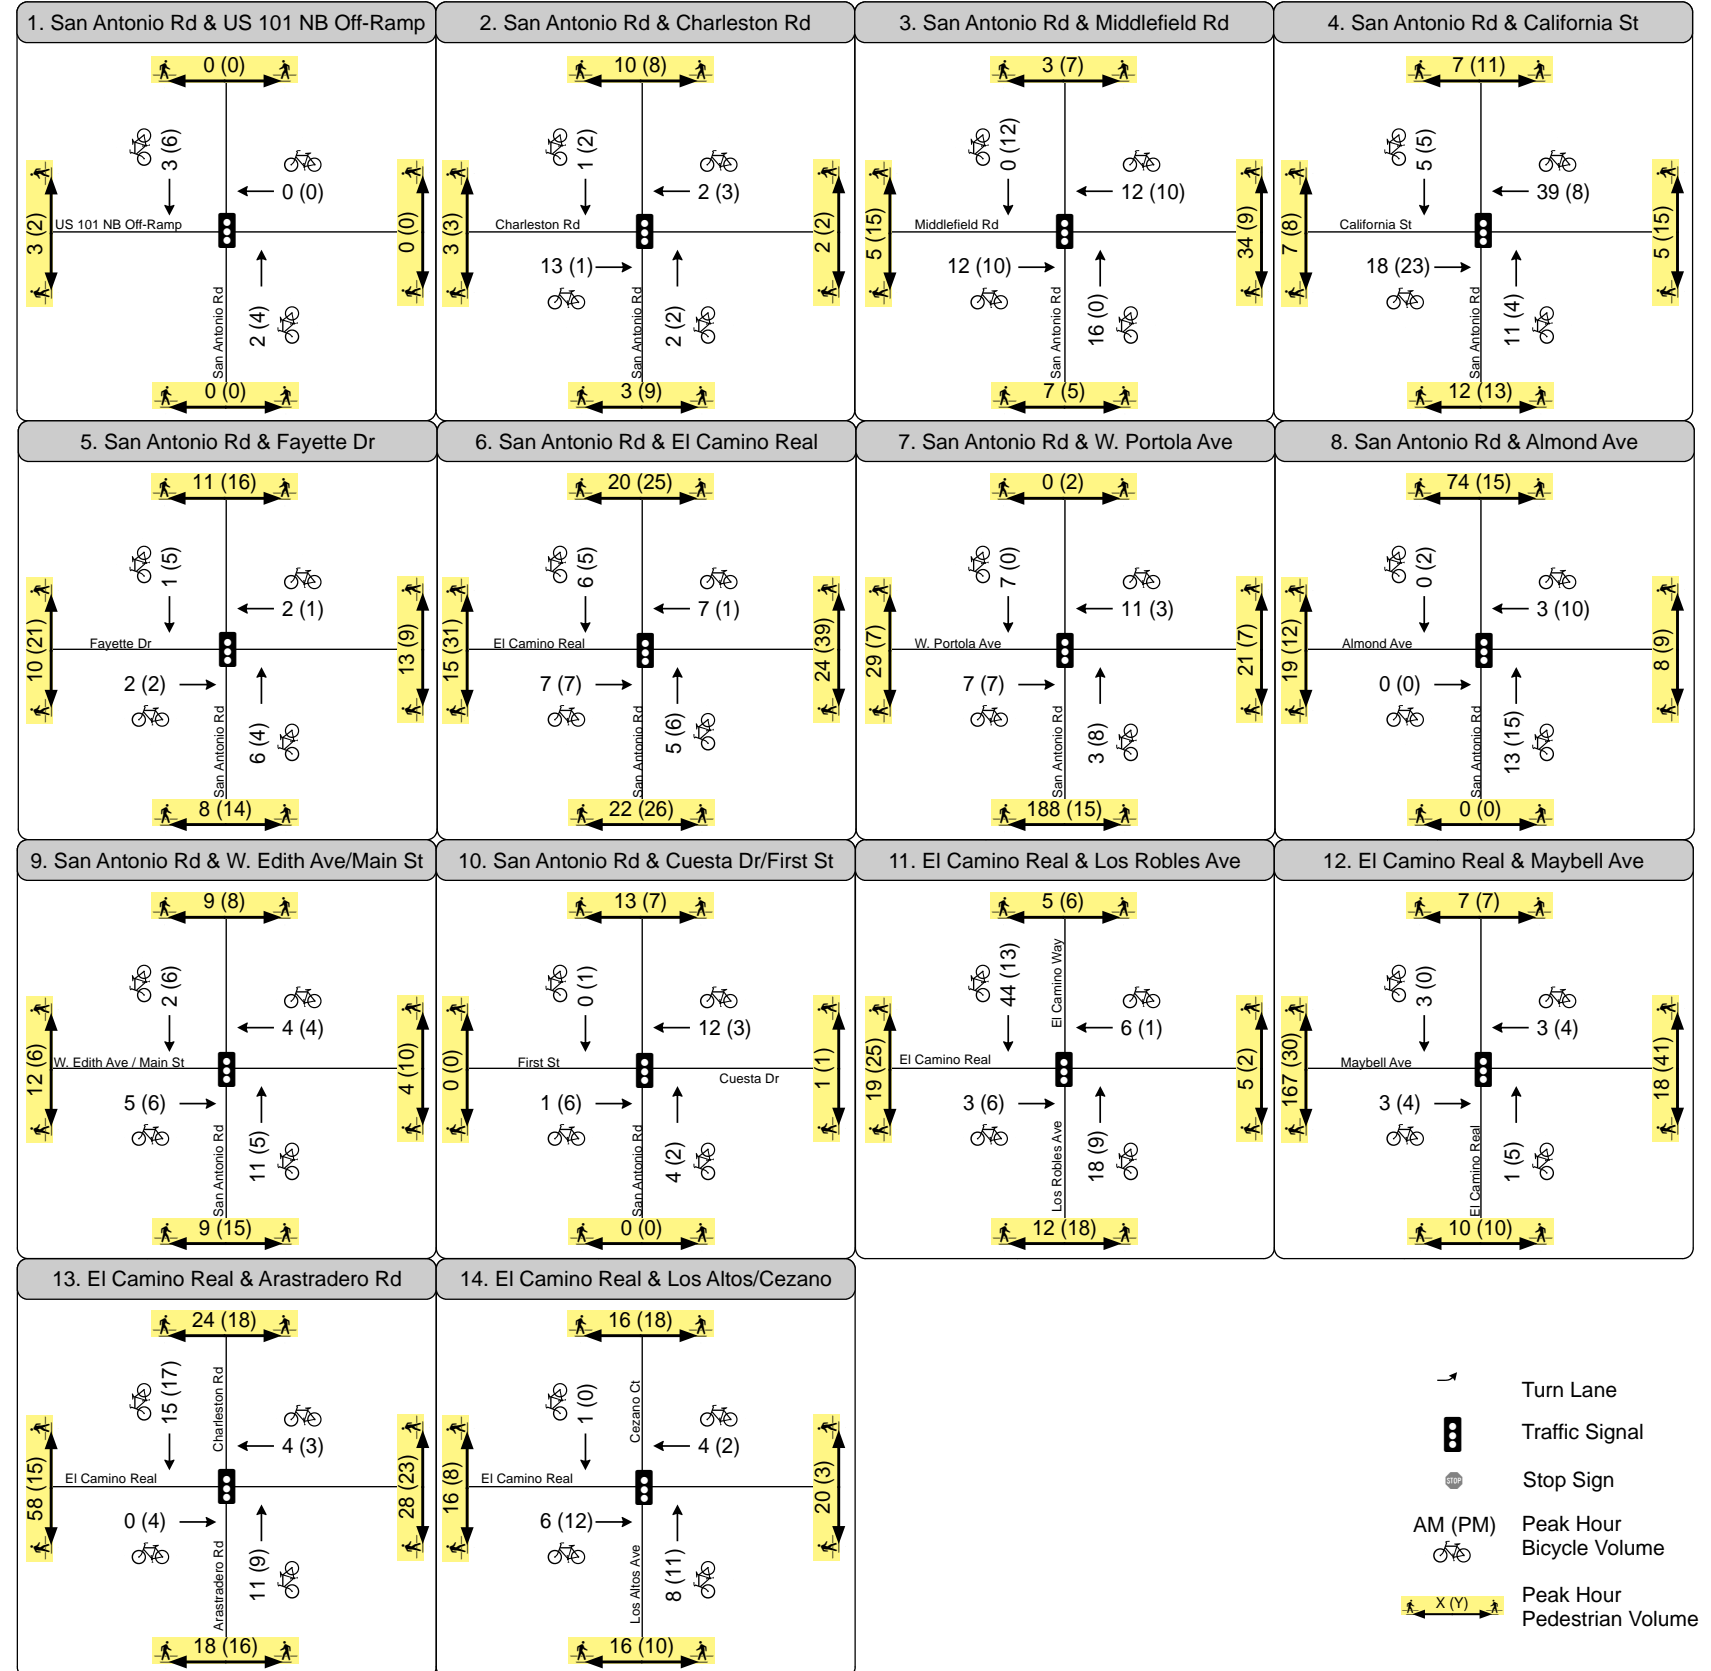

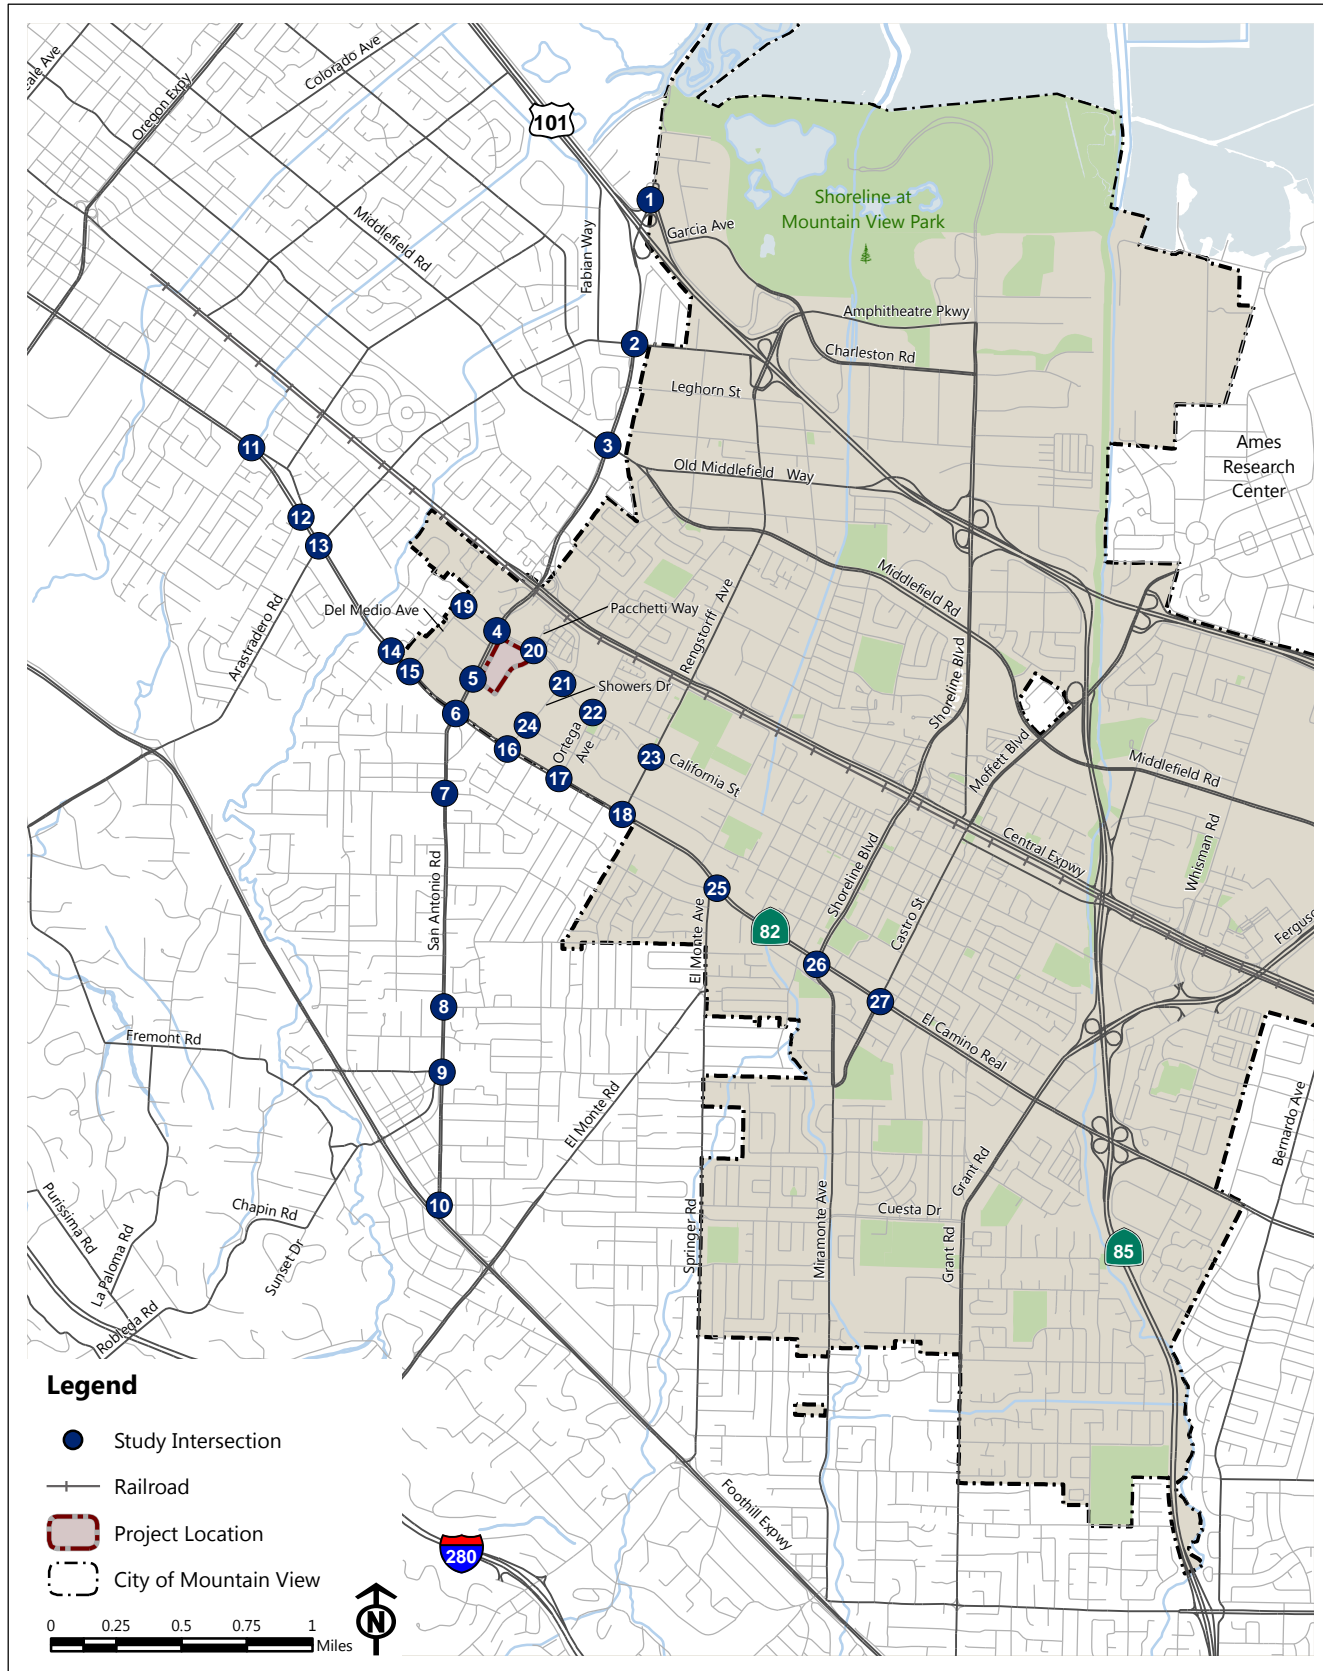

Notes:

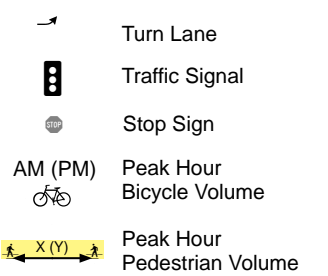

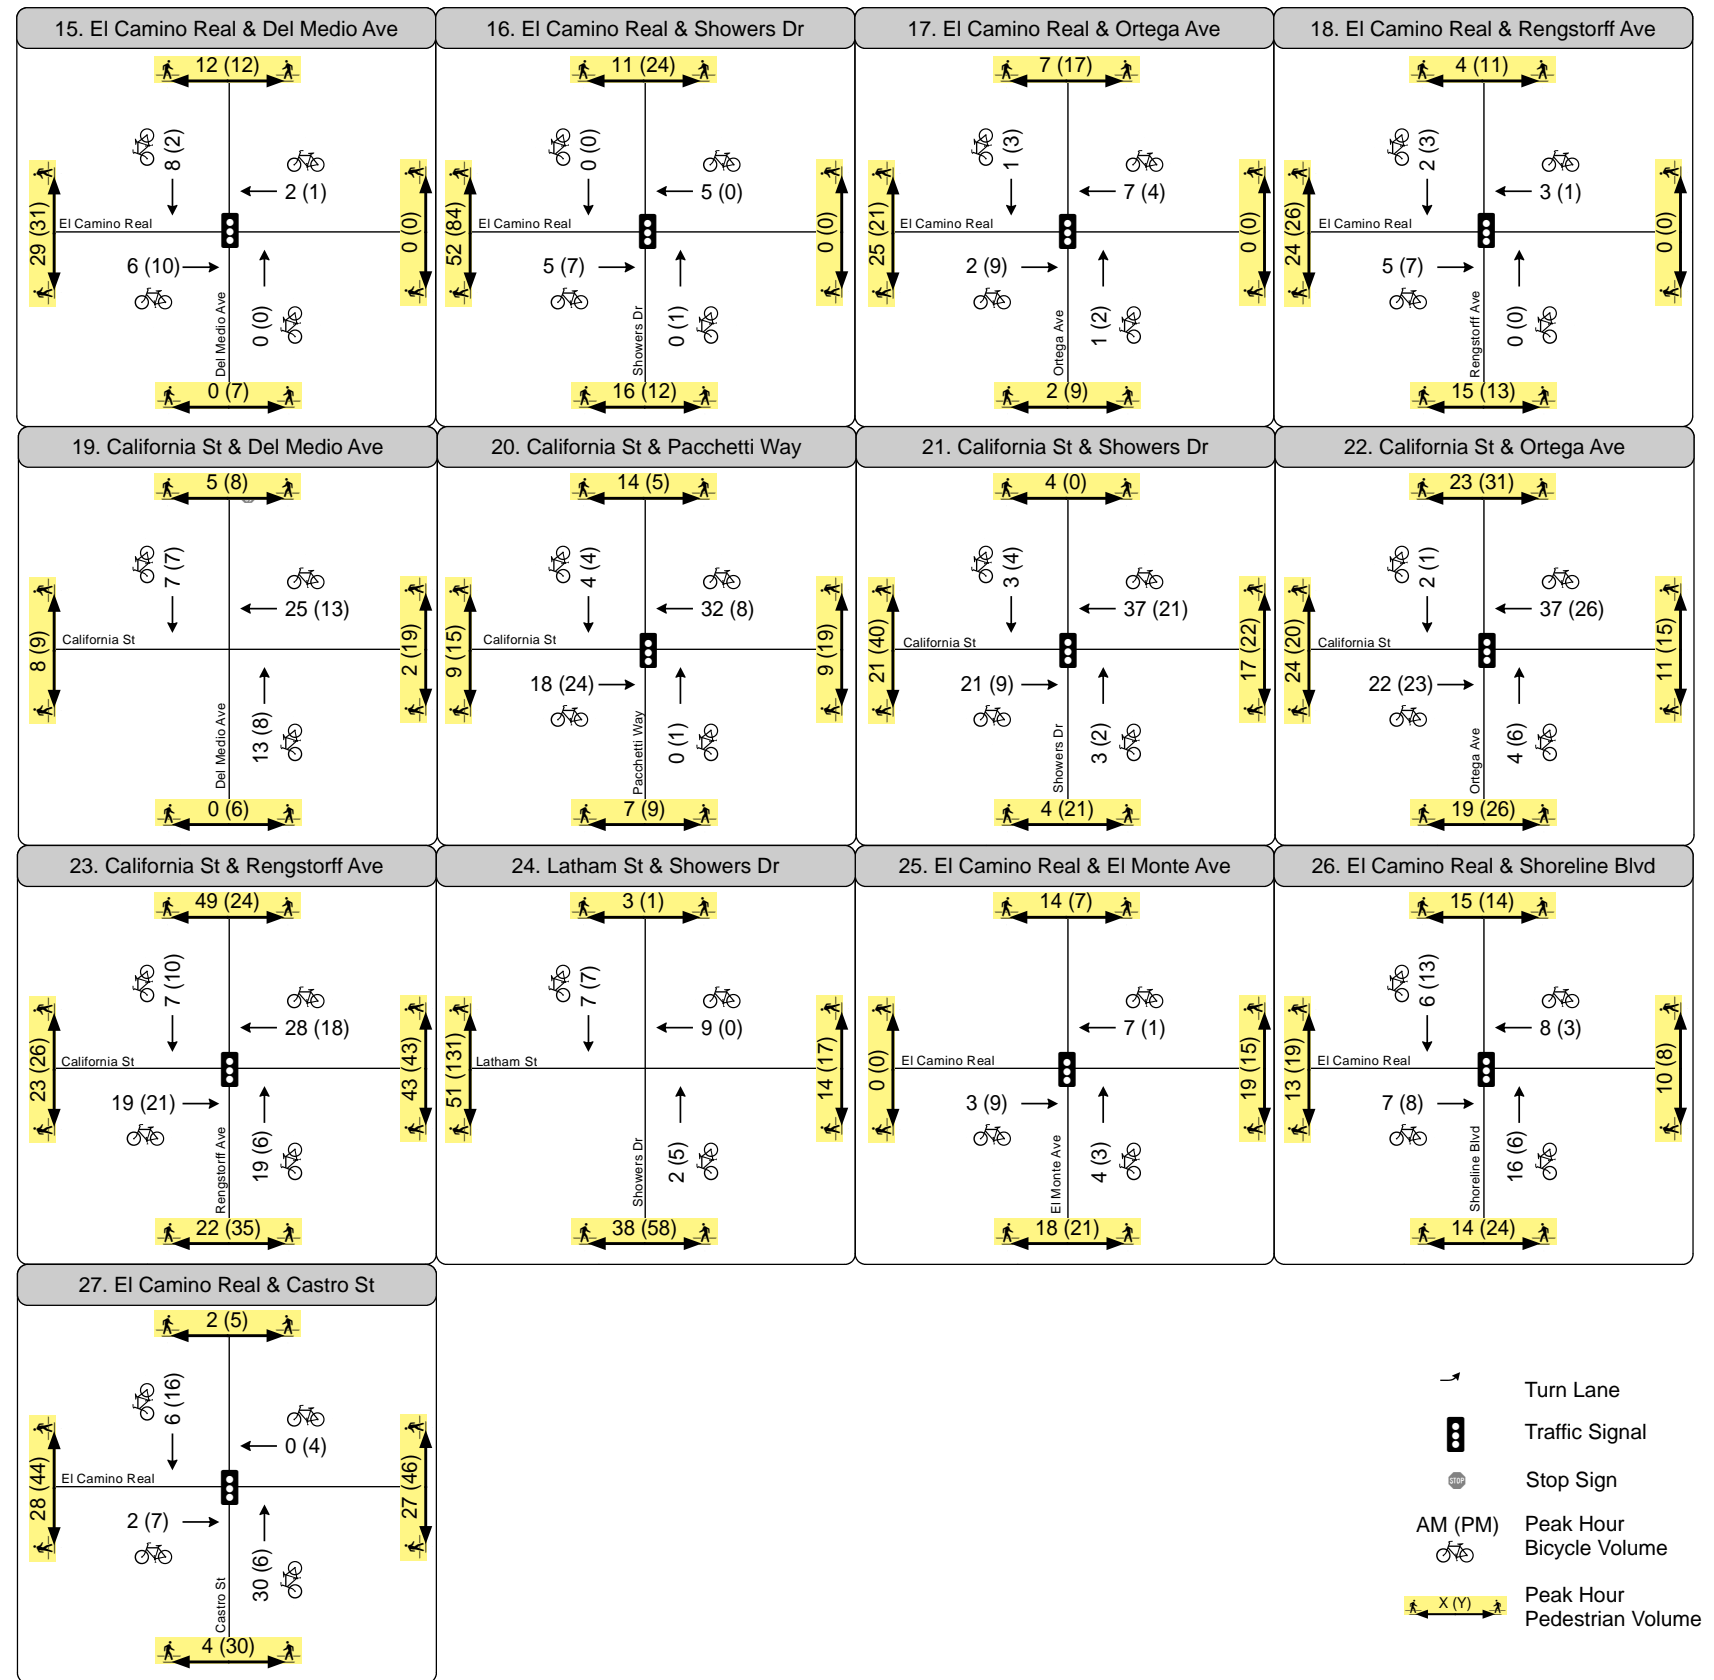

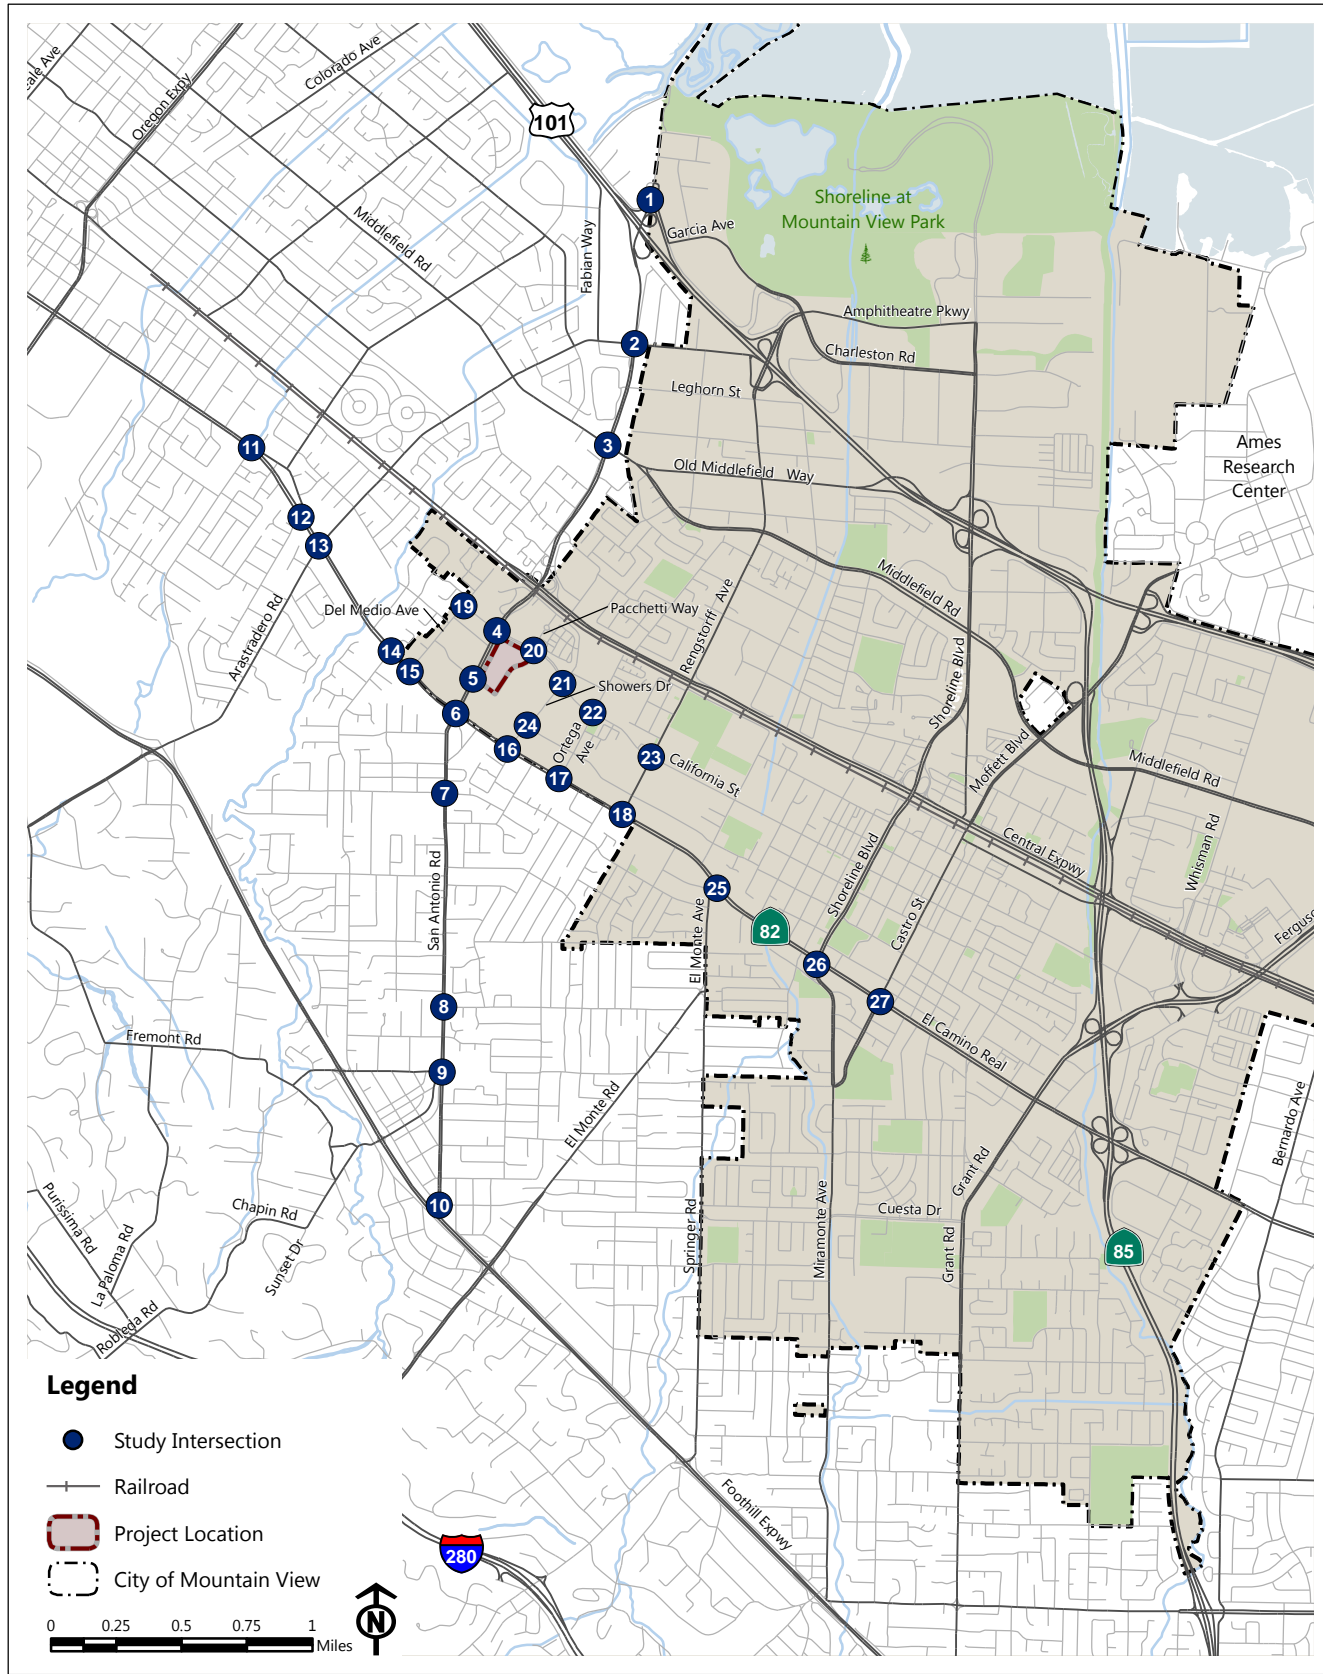

1. Weekday and weekend service as of July 2013.
2. Headways are defined as the time between transit vehicles on the same route (e.g. time between two Route 22 buses stopping at the San Antonio Transit Center). Headways measured in minutes.
3. Peak load factor for entire route. The peak load factor is the ratio of the average peak number of on-board passengers during the peak hour to supply of seats.
4. Data from March 2013 provided by VTA.
5. Caltrain load factor based on overall system peak boardings. The peak periods identified were 7-8 AM and 5-6 PM.
6. Stanford Marguerite Shuttle average weekday and weekend boardings during 2012 peak period (5:00 PM to 6:00PM).

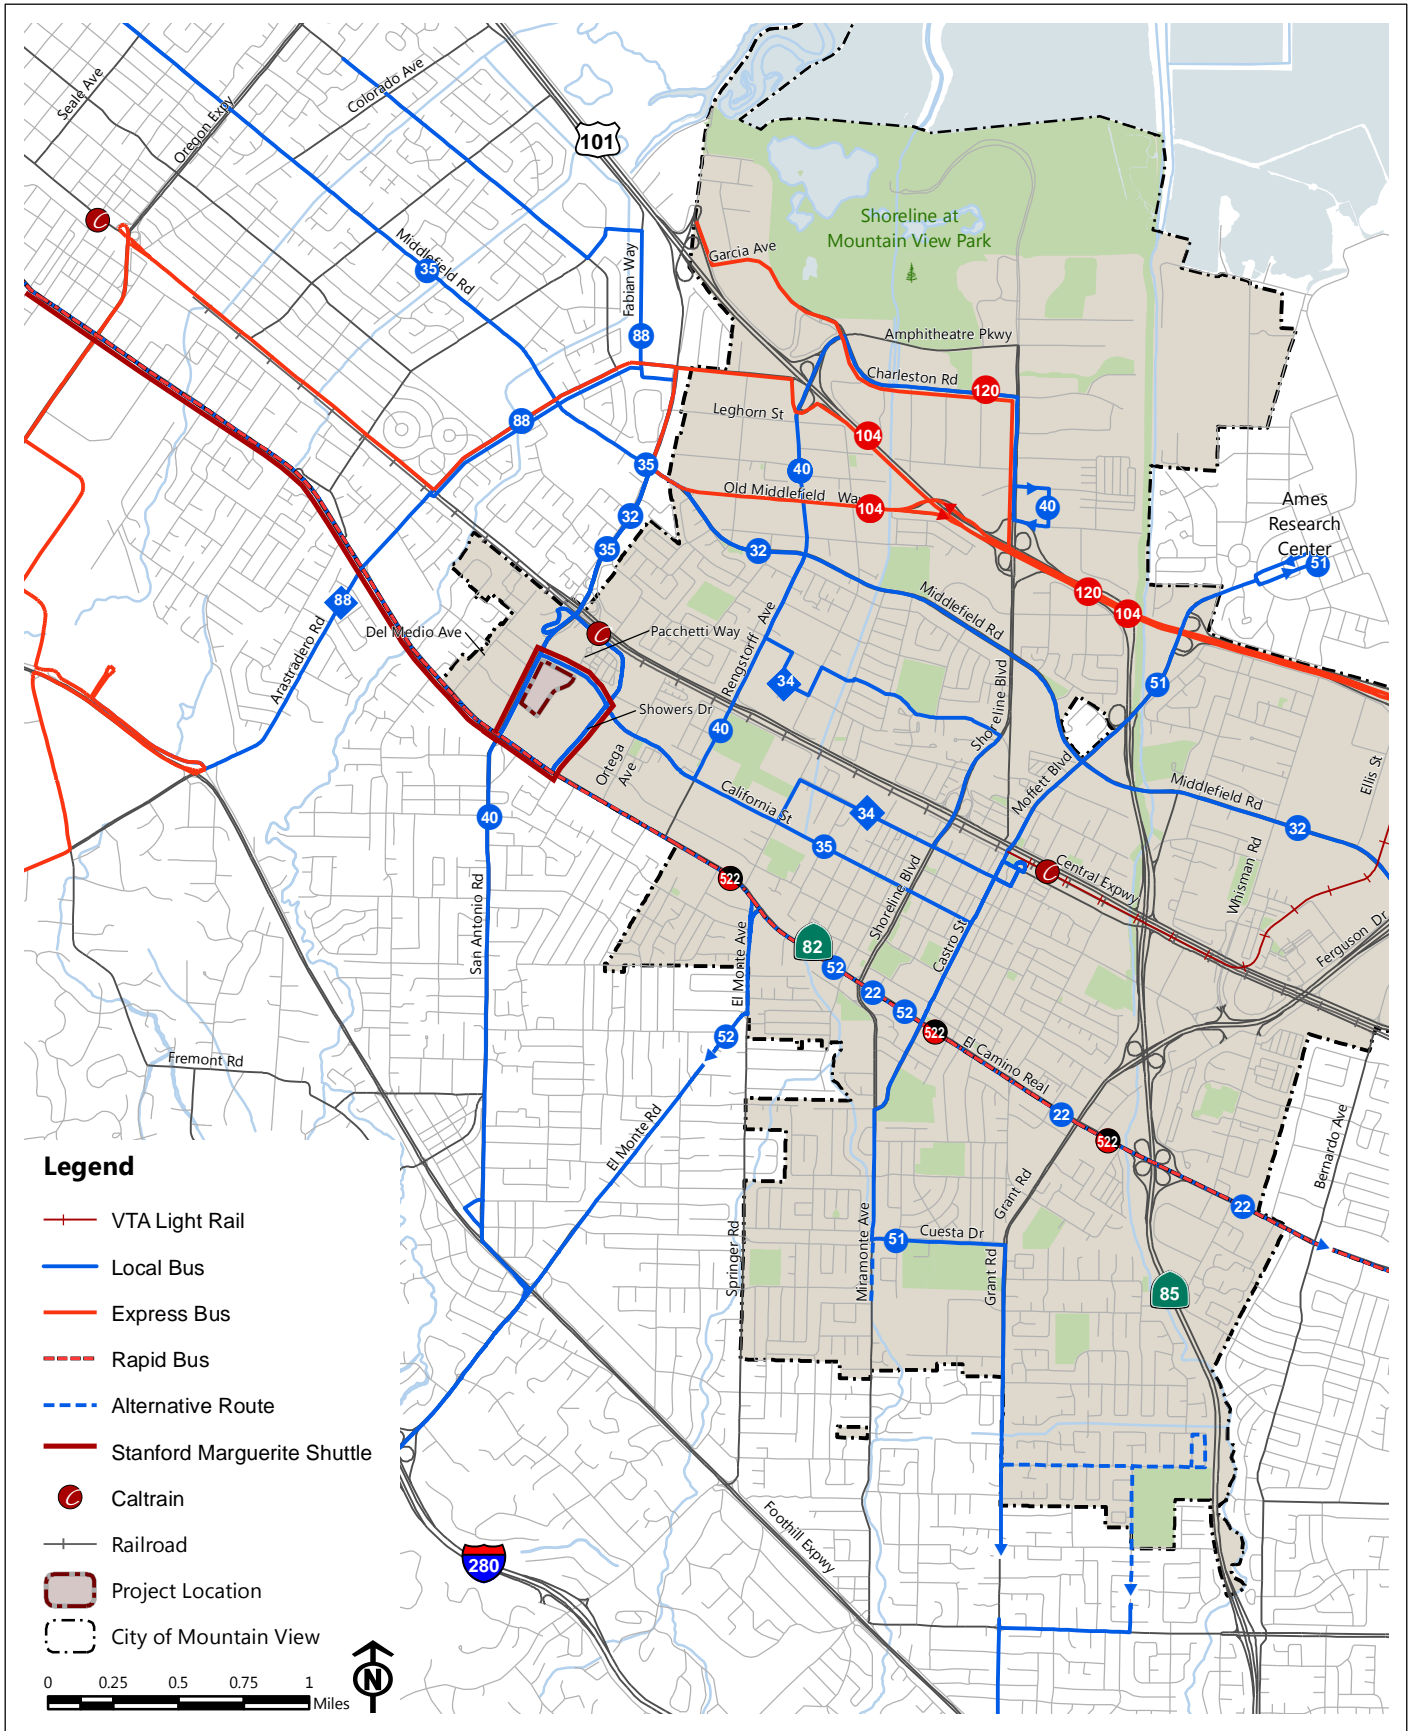

Sources: VTA August 2013; Caltrain, February 2013; Caltrain, Stanford University, August 2013.

EXISTING INTERSECTION VOLUMES AND LANE CONFIGURATIONS

Weekday morning (7:00 to 9:00 AM) and evening (4:00 to 6:00 PM) peak period intersection turning movement counts were conducted at the study locations in May and June 2013 with area schools in-session. Counts for intersections that were added after the initial scoping process were completed in September 2013, after schools had come back from summer recess. These turning movement counts were verified against prior counts from other sources such as the North Bayshore project and Phase I TIA. In some cases, the prior counts were used instead of the 2013 counts in order to provide a conservative analysis.

The single hour with the highest traffic volumes during each count period was identified as the peak hour. Existing lane configurations and signal controls were obtained through field observations. The peak hour volumes are presented on **Figure 7** along with the existing lane configurations and traffic control devices (stops signs or traffic signals). Detailed traffic count data are contained in **Appendix A**.

EXISTING INTERSECTION LEVELS OF SERVICE

Existing intersection lane configurations, signal timings, and peak hour turning movement volumes were used to calculate the levels of service for the key intersections during each peak hour. The results of the LOS analysis using the Traffix software program for Existing Conditions are presented in **Table 5. Appendix B** contains the corresponding LOS calculation sheets.

The results of the LOS calculations indicate that all of the study intersections currently operate at acceptable levels of service according to their designated LOS standard (LOS D or better for most study intersections; LOS E or better for San Antonio Center Planning Area intersections and CMP intersections).

TABLE 5: EXISTING INTERSECTIONS LEVELS OF SERVICE

Intersection		Control	Peak Hour ¹	Delay ²	LOS ³
1	San Antonio Road and US 101 Northbound Off-Ramp (MV)	Signal	AM PM	11.8 10.8	B+ B+
2	San Antonio Road and Charleston Road (PA)*	Signal	AM PM	36.0 38.9	D+ D+

27	El Camino Real and Castro Street (MV)*	Signal	AM PM	27.0 31.4	C D

Notes:

1. AM = morning peak hour, PM = evening peak hour
2. Whole intersection weighted average control delay expressed in second per vehicle for signalized intersections and all-way stop-controlled intersections. Total control delay for the worst movement is presented for side-street stop controlled intersections. Intersections include adjusted saturation flow rates to reflect Santa Clara County conditions per VTA guidelines.
3. LOS = Level of Service. LOS calculations conducted using the Traffix level of service analysis software package, which applies the method described in the 2000 Highway Capacity Manual.

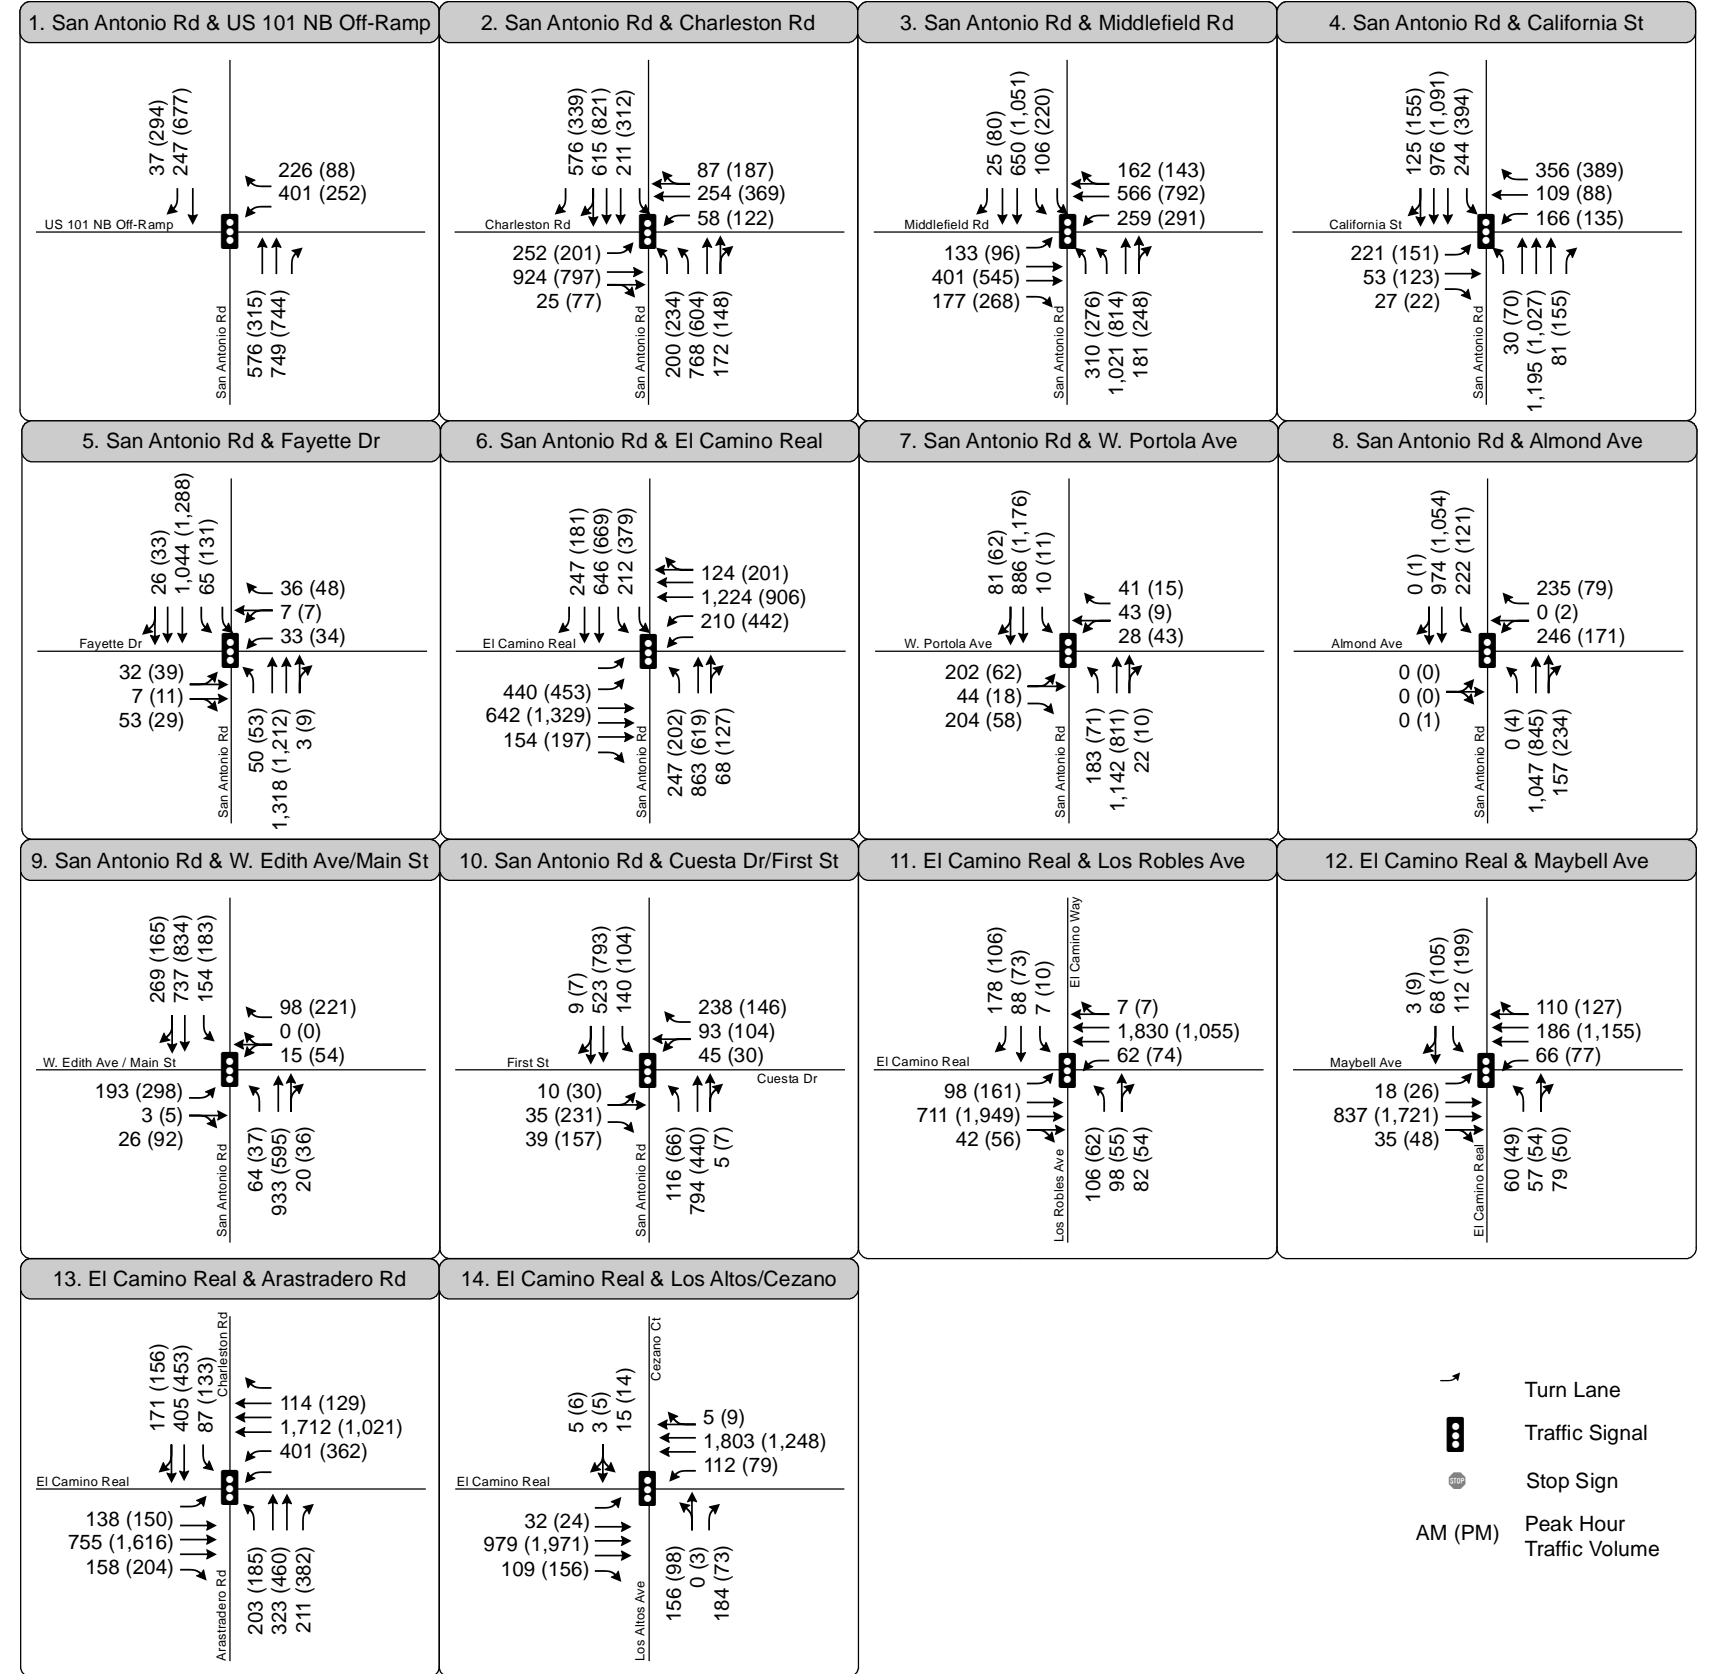

Bold text indicates intersection operates at a deficient Level of Service.

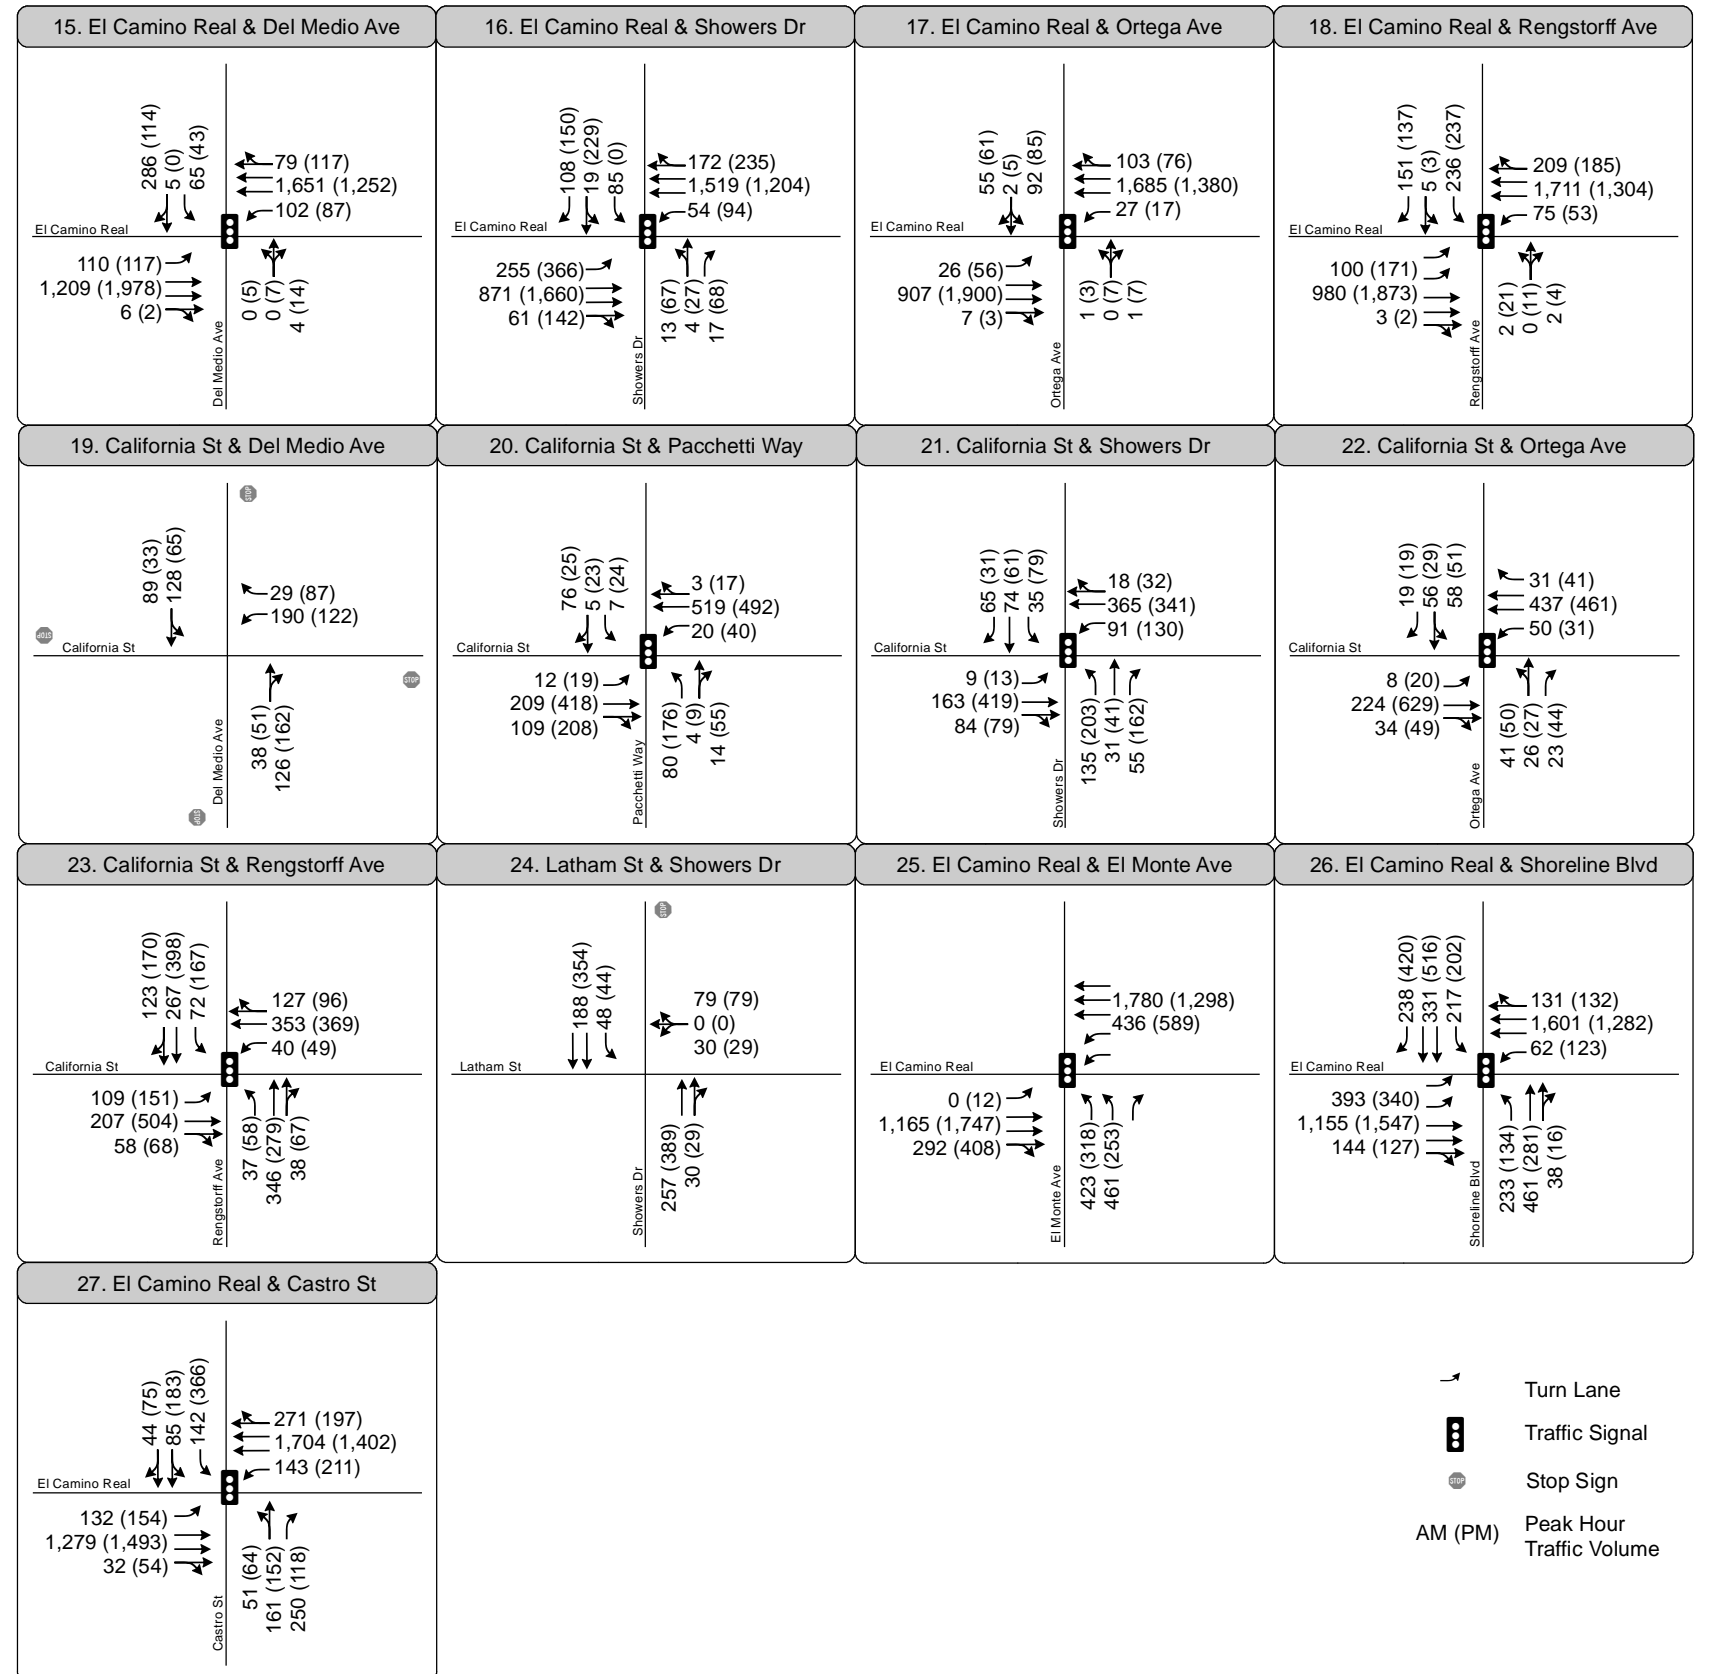

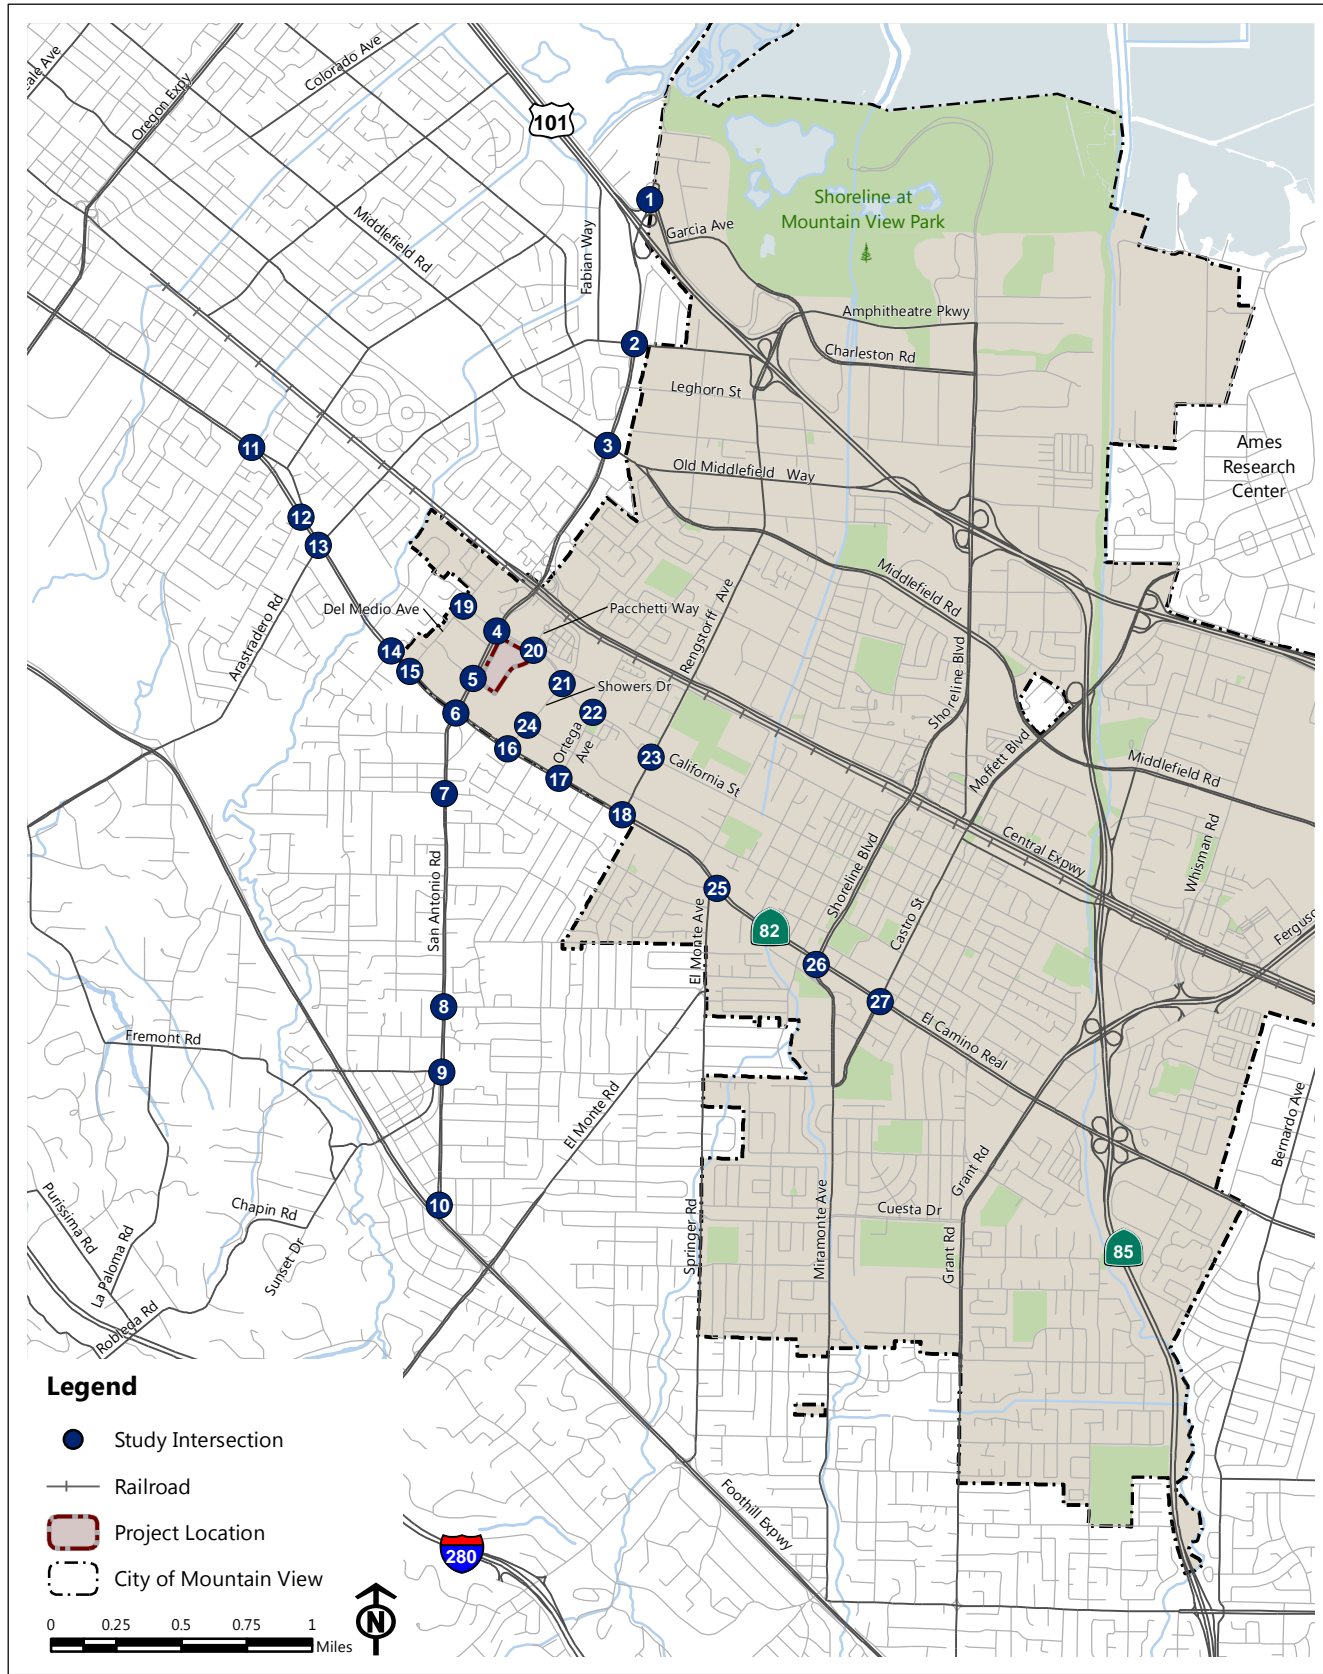

AWSC = All-Way Stop Control; SSSC = Side-Street Stop Control

LA = Los Altos; MV = Mountain View; PA = Palo Alto

* = CMP Intersection (LOS E threshold); ** = San Antonio Center Planning Area (LOS E threshold)

Source: Fehr & Peers, November 2013.

EXISTING FREEWAY SEGMENT LEVELS OF SERVICE

The existing AM and PM peak hour mixed-flow and HOV-lane freeway segment densities reported in VTA's *2011 Monitoring and Conformance Report* (June 2012) are presented in **Table 6**. For mixed-flow lanes, freeway segment capacities are defined as 2,200 vehicles per hour per lane (vphpl) for four-lane freeway segments and 2,300 vphpl for six-lane freeway segments. HOV lane capacities are defined as 1,650 vphpl. The freeway congestion shown in Table 6 is consistent with the Caltrans *2008 State Highway Congestion Monitoring Program* (HICOMP): *Annual Data Compilation* (Caltrans, September 2009) reported areas of mid-week peak hour congestion on US 101. **Appendix D** contains the corresponding LOS calculation sheets.

TABLE 6: EXISTING FREEWAY SEGMENT LEVELS OF SERVICE

Freeway Segment	Peak Hour ¹	Lanes		Density ²		LOS ³	
		Mixed	HOV	Mixed	HOV	Mixed	HOV
US 101 – Northbound							
North Shoreline Blvd. and Rengstorff Avenue	AM	3	1	78	87	F	F
	PM	3	1	98	38	F	D
Rengstorff Avenue and San Antonio Road	AM	3	1	66	56	F	E
	PM	3	1	83	37	F	D
San Antonio Road and Oregon Expressway	AM	3	1	62	54	F	E
	PM	3	1	56	35	E	D
US 101 – Southbound							
Oregon Expressway and San Antonio Road	AM	3	1	50	41	E	D
	PM	3	1	71	61	F	F
San Antonio Road and Rengstorff Avenue	AM	3	1	46	43	D	D
	PM	3	1	84	47	F	E
Rengstorff Avenue and North Shoreline Blvd.	AM	3	1	50	40	E	D
	PM	3	1	54	35	E	D

Notes:

1. AM = morning peak hour, PM = evening peak hour.

2. Measured in passenger cars per mile per lane. Mixed = Mix-Flow; HOV = High-Occupancy Vehicle.

3. Level of service based on density.

Bold text indicates unacceptable operations by jurisdiction level of service standard (LOS F for CMP-designated facilities).

Source: *2011 Monitoring & Conformance Report*, VTA, June 2012; Fehr & Peers, November 2013.

The following Mixed-Flow freeway segments exceed VTA's LOS E standard during the specified peak hour:

- US 101 Northbound Mixed-Flow Lanes
 - North Shoreline Boulevard and Rengstorff Avenue (AM and PM Peak Hours)
 - Rengstorff Avenue and San Antonio Road (AM and PM Peak Hours)
 - San Antonio Road and Oregon Expressway (AM Peak Hour)
- US 101 Southbound Mixed-Flow Lanes
 - Oregon Expressway and San Antonio Road (PM Peak Hour)
 - San Antonio Road and Rengstorff Avenue (PM Peak Hour)

The following HOV lane freeway segment exceeds VTA's LOS E standard during the specified peak hour:

- US 101 Northbound between North Shoreline Blvd. and Rengstorff Avenue (AM Peak Hour)
- US 101 Southbound between San Antonio Road and Oregon Expressway (PM Peak Hour)

FIELD OBSERVATIONS

Field observations at the project site and at study area locations were conducted during the weeks of August 5th and August 19th to collect existing driveway count data, verify the calculated LOS operations, and observe the overall transportation operations. In general, observations indicated that most of the study intersections are operating at or near the calculated levels of service.

The San Antonio Road Corridor operates at LOS D+ or worse during the morning and evening peak hours between El Camino Real and Charleston Road. Queues on San Antonio Road extend to the adjacent intersections frequently in both directions during both peak hours. There are significant pedestrian movements in the area, which contributes to the queuing. The queuing lasts for short peaks within the peak hour and completely dissipates by the end of the hour.

The intersection of El Camino Real and Arastradero Road / Charleston Road is also quite congested during the AM and PM peak hours. During the morning peak hour, the eastbound approach experiences heavy queuing, occasionally requiring multiple signal cycles to clear. During the evening peak hour, the westbound approach experience heavy queuing, though the queue typically clears during each cycle.

3. PROJECT TRANSPORTATION CHARACTERISTICS

This chapter presents the method used to estimate the amount of traffic generated by the proposed development and how it will be distributed to the roadway system. The amount of traffic added to the roadway system is estimated using a three-step process: (1) trip generation, (2) trip distribution, and (3) trip assignment. The first step estimates the amount of traffic added to the roadway network. The second step estimates the directions of travel to and from the project site. The new trips are assigned to specific street segments and intersection turning movements during the third step. The results of the process are described in the following sections.

TRIP GENERATION

The purpose of the vehicular trip generation estimate is to approximate the number of new vehicle trips entering and exiting the site for various purposes (e.g., employee trips and visitor trips) during a selected time period. The proposed project will contain a 167-room hotel, 54,184 square feet of retail space, 392,853 square feet of office space, 28,502 square feet of flexible commercial space, 35,358 square feet of restaurant space, and a cinema with 1,710 seats.

The amount of AM and PM peak hour vehicle traffic was estimated using information for appropriate land uses published in the Institute of Transportation Engineers' (ITE) *Trip Generation Manual, 9th Edition* (2012). The vehicle trip generation estimates were developed using the equations for "Hotel" (ITE Land Use 310), "Shopping Center" (ITE Land Use 820), "General Office" (ITE Land Use 710), "Quality Restaurant" (ITE Land Use 931), and "Multiplex Movie Theater" (ITE Land Use 445). The "General Office" equations were used for the commercial space as it could be used as either office or retail space.

TRIP REDUCTIONS

Reductions were applied based on the mix of uses, which would cause some of the trips to remain within the site. These reductions were calculated based on the VTA *Transportation Impact Analysis Guidelines* (2009) and were applied to the Retail, Restaurant, and Hotel uses, per direction from the City of Mountain View. Reductions applied to office-related trips are described below.

A 30 percent reduction in office-related trips was applied based on the City's agreement with the developer for a TDM Plan with a 30 percent trip reduction target. This reduction also accounts for office employees using Caltrain as their commute mode. The TDM Plan is discussed further in Chapter 7.

Some vehicle trips going to and from the retail and restaurant uses will come from vehicles already passing by the site on San Antonio Road, California Street, and El Camino Real. Therefore, pass-by reductions were applied to traffic generated by those uses based on VTA TIA Guidelines.

There is an existing retail building on the site (with a Ross store and a Bev Mo) that is currently occupied and is generating traffic. Traffic counts were conducted to assess the amount of traffic generated by those uses, as they will be replaced by the project. Existing use traffic was subtracted from estimated traffic generated by the project (after the previous reductions were applied).

More than 88,000 square feet of retail use had been studied during the Phase I analysis for the Phase II site and was previously approved and entitled for this site. This previously approved Phase II retail use would generate roughly 85 AM peak hour trips and 320 PM peak hour trips, per the Phase I EIR. No reduction was given to the Phase 2 development for these previously approved trips.

TRIP GENERATION ESTIMATES

The estimates were developed for a typical weekday and during the AM and PM peak hours of the adjacent roadway system. The trip generation estimates are summarized in **Table 7**. The project is estimated to generate 6,805 daily vehicle trips, with 571 occurring during the AM peak hour (472 in and 99 out), and 839 occurring during the PM peak hour (278 in and 561 out). The trip generation table, complete with trip generation equations and explanations for all of the reductions, is available in **Appendix G**.

Cinema Trip Generation

The ITE cinema weekday PM peak hour trip generation rate (0.08 trips/seat) used in this analysis is based on two surveys. City staff requested that additional information be provided to support this rate. The ITE Friday PM peak hour (4:00 to 6:00 PM) rate is based on 14 studies that resulted in a rate of 0.10 trips/seat. One would expect the Friday PM peak hour cinema rate would be a bit higher than the weekday PM peak hour rate. Therefore the PM peak hour rate of 0.08 trips/seat is reasonable when compared to the Friday PM peak hour rate of 0.10 trips/seat.

Additionally, Fehr & Peers obtained the results of surveys conducted at the Century Cinema in Mountain View.² Those results indicate that approximately 0.05 trips/seat are generated on a midweek weekday during the overall peak hour (4:00 to 6:00 PM) and approximately 0.12 trips/seat are generated on a Friday evening during the site's peak hour (6:00 to 7:00 PM). These rates are in line with the ITE rates stated above. Fehr & Peers also estimated a daily trip generation rate from related ITE land uses and weekend trip generation data. The cinema is projected to generate approximately six times as many daily trips as during the PM peak hour.

² *Trip Generation Estimate for the Proposed Albuquerque 24 Cinema Project*. Barton-Aschman, 1995.

Friday Night Trip Generation

The project includes restaurants and cinemas, uses that reach their peak traffic generation on Friday evenings after the PM commute period and on Saturday evenings. Friday night trip generation estimates were developed to determine whether these uses would influence the overall peak traffic generation period of the site. A temporal distribution was used to determine Friday trip generation between 5:00 and 9:00 PM.

This analysis shows that during a Friday night the site would generate, at most, an equivalent number of vehicle trips than during the mid-week PM peak hour. However, this maximum occurs after 7:00 PM, when the base level of traffic on the network is significantly less than the during the midweek commute PM peak hour. Therefore, the midweek PM peak hour is the time period with the highest overall traffic volumes and the most potential for significant impacts and is therefore used for all evaluations in this analysis. A comparison of the project trip generation estimates for the different time periods is shown in Appendix G.

TRIP DISTRIBUTION

Trip distribution is defined as the directions of approach and departure that vehicles would use to arrive at and depart from the site. The directions of approach and departure of project trips were based on the locations of complementary land uses, existing travel patterns in the area, patterns used in other studies, and the locations of project site driveways. U.S. Census data for place-to-place commuting for the City of Mountain View was used to further refine the distribution for office-related trips. The general directions of approach and departure for office and non-office uses are shown in **Figure 8**.

TRIP ASSIGNMENT

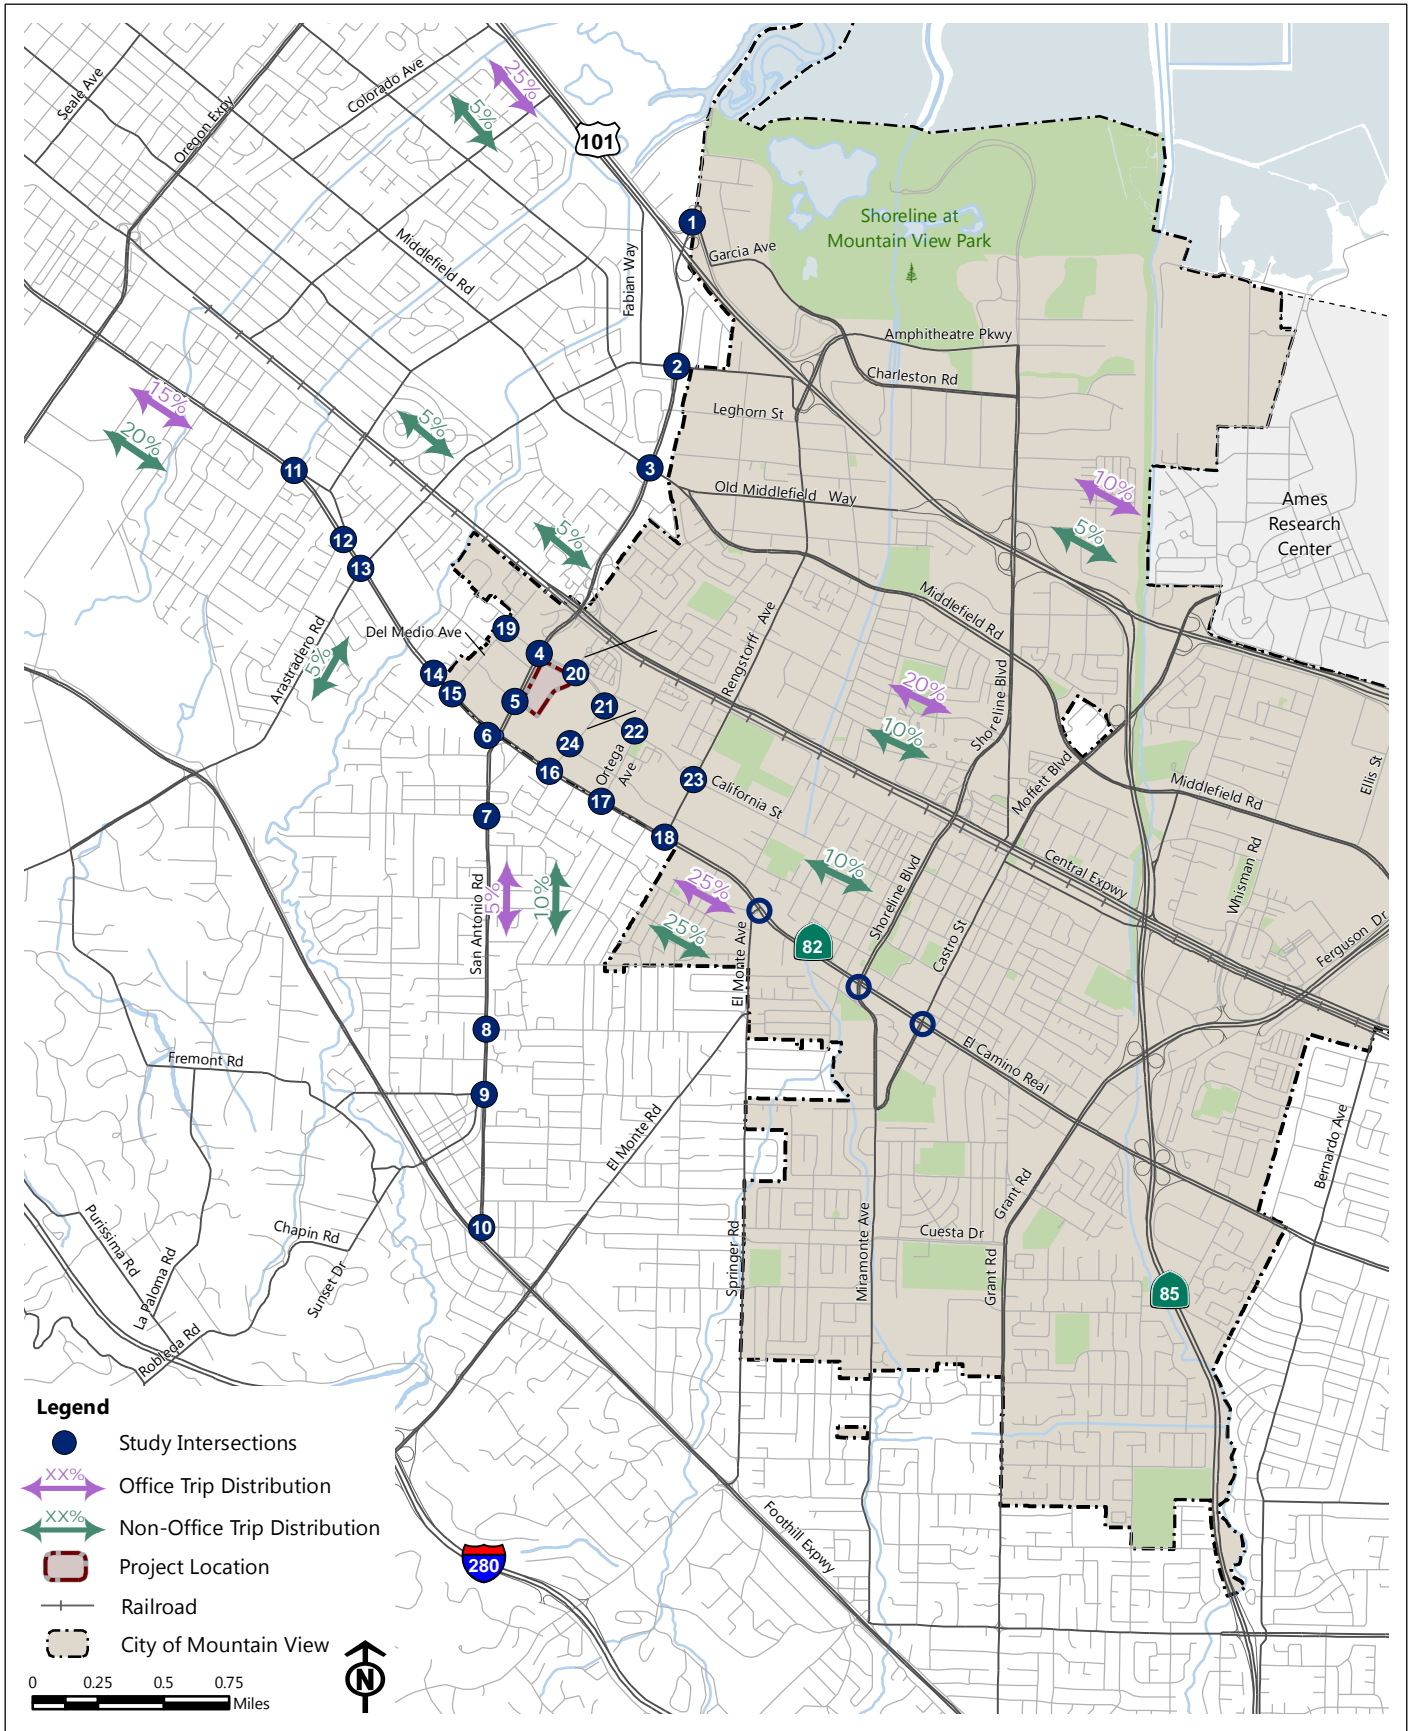

The project trips were assigned to the roadway system based on the directions of approach and departure discussed above. **Figure 9** shows the number of net new project trips assigned to each turning movement at each study intersection. The trip assignment was added to the existing volumes to establish volumes under Existing Plus Project Conditions, as shown on **Figure 10**.

4. EXISTING PLUS PROJECT CONDITIONS

This chapter presents the impacts of the proposed project on the surrounding transportation system under Existing Plus Project Conditions. Existing Plus Project Conditions are defined as Existing Conditions with completion of the project. Impacts to the roadway system under this scenario are identified by comparing the level of service results under Existing Plus Project Conditions (with traffic generated by the proposed project added to existing volumes) to those under Existing Conditions.

EXISTING PLUS PROJECT INTERSECTION LEVELS OF SERVICE

Level of service calculations were conducted to evaluate intersection operations under Existing Plus Project Conditions. The results of the LOS analysis are summarized in **Table 8**.

The results for Existing Conditions are included for comparison purposes, along with the projected increases in critical delay and critical volume-to-capacity (V/C) ratios. Critical delay represents the delay associated with the critical movements of the intersection, or the movements that require the most “green time” and have the greatest effect on overall intersection operations. The changes in critical delay and critical V/C ratio between Existing and Existing Plus Project Conditions are used to identify significant impacts.

At times, intersections may show a reduction in average delay with the addition of project traffic, which is counter-intuitive. However, the average delay values in the table are weighted averages. Weighted average delays will be reduced when traffic is added to a movement with a low delay.³ Conversely, relatively small volume increases to movements with high delays can substantially increase the weighted average delay.

The corresponding LOS calculation sheets are included in Appendix B. The results of the LOS calculations indicate that all of the study intersections still operate at acceptable levels of service in the Existing Plus Project scenario. The intersection of San Antonio Road and California Street operates at LOS E+ in the AM peak hour; it is part of the San Antonio Center Planning Area, which has an LOS E threshold.

³ For example, if there is one movement with 10 vehicles and a delay of 100 seconds and another movement with 400 vehicles and 10 seconds of delay, the weighted average delay is calculated as $(100 \text{ seconds} \times 10 \text{ vehicles} + 10 \text{ seconds} \times 400 \text{ vehicles}) / 410 \text{ vehicles} = 12.2 \text{ seconds per vehicle}$. Now if 100 vehicles are added to the movement with 10 seconds of delay, the weighted average delay is calculated as $(100 \text{ seconds} \times 10 \text{ vehicles} + 10 \text{ seconds} \times 500 \text{ vehicles}) / 510 \text{ vehicles} = 11.8 \text{ seconds per vehicle}$. The weighted average delay improves, even though more vehicles are added.

SIGNAL WARRANT ANALYSIS

The MUTCD contains a number of guidelines, called warrants, to determine whether the installation of a traffic signal at a particular location is appropriate. The peak-hour signal warrant, one of eight warrants, was evaluated for the unsignalized intersections under both Existing and Existing Plus Project Conditions. The two unsignalized locations for this project are the intersections of California Street / Del Medio Avenue and Showers Drive / Latham Street. The results indicate that a traffic signal is not warranted at either of these locations based on the peak-hour warrant. **Appendix C** contains the peak-hour signal warrants. As shown in Table 8, both unsignalized intersections are operating at acceptable levels of service.

This analysis is intended to examine the general correlation between the planned level of future development and the need to install new traffic signals. The peak-hour signal warrant analysis should not serve as the only basis for deciding whether and when to install a traffic signal. To reach such a decision, the full set of warrants should be investigated based on a thorough study of traffic and roadway conditions by an experienced engineer. The decision to install a signal should not be based solely upon the warrants, since the installation of signals can lead to certain types of collisions. The responsible state or local agency, or the project sponsor (for private roads), should undertake regular monitoring of actual traffic conditions and accident data and timely re-evaluation of the full set of warrants in order to prioritize and program intersections for signalization.

INTERSECTION IMPACTS AND MITIGATION

Based on the impact criteria listed in Chapter 1, the results of the LOS calculations indicate that all of the study intersections operate at acceptable levels of service in the Existing Plus Project scenario. Therefore, no mitigation is required under this scenario.

EXISTING PLUS PROJECT FREEWAY LEVEL OF SERVICE

Freeway segments of US 101 were analyzed during the AM and PM peak hours to calculate the amount of project traffic projected to be added. **Table 9** and **10** show the results of the freeway impact analysis for the AM and PM peak periods, respectively.

On freeway segments that are already operating at LOS F during the AM and PM peak period, the added project traffic would not constitute more than one percent of the freeway's capacity. On freeway segments that are currently operating at LOS E or better, the project traffic would not cause the LOS to decline to LOS F.

Therefore, the project is estimated to have a less-than-significant impact on the freeway system. Appendix D contains the corresponding LOS calculation sheets.

TABLE 9: EXISTING PLUS PROJECT FREEWAY SEGMENT AM PEAK PERIOD LEVELS OF SERVICE

Freeway Segment	Existing LOS		Project Trips Added ¹		Percent Trips Added ²		Project LOS ³	
	Mixed	HOV	Mixed	HOV	Mixed	HOV	Mixed	HOV

5. BACKGROUND CONDITIONS

This chapter presents the results of the level of service calculations under Background Conditions with and without the project. Background Conditions are defined as conditions prior to completion and occupancy of the proposed development. Traffic volumes for Background Conditions comprise existing volumes plus traffic generated by approved but not yet constructed and occupied developments in the area. Background Plus Project Conditions are defined as Background Conditions plus net new traffic generated by the proposed project.

BACKGROUND TRAFFIC VOLUMES

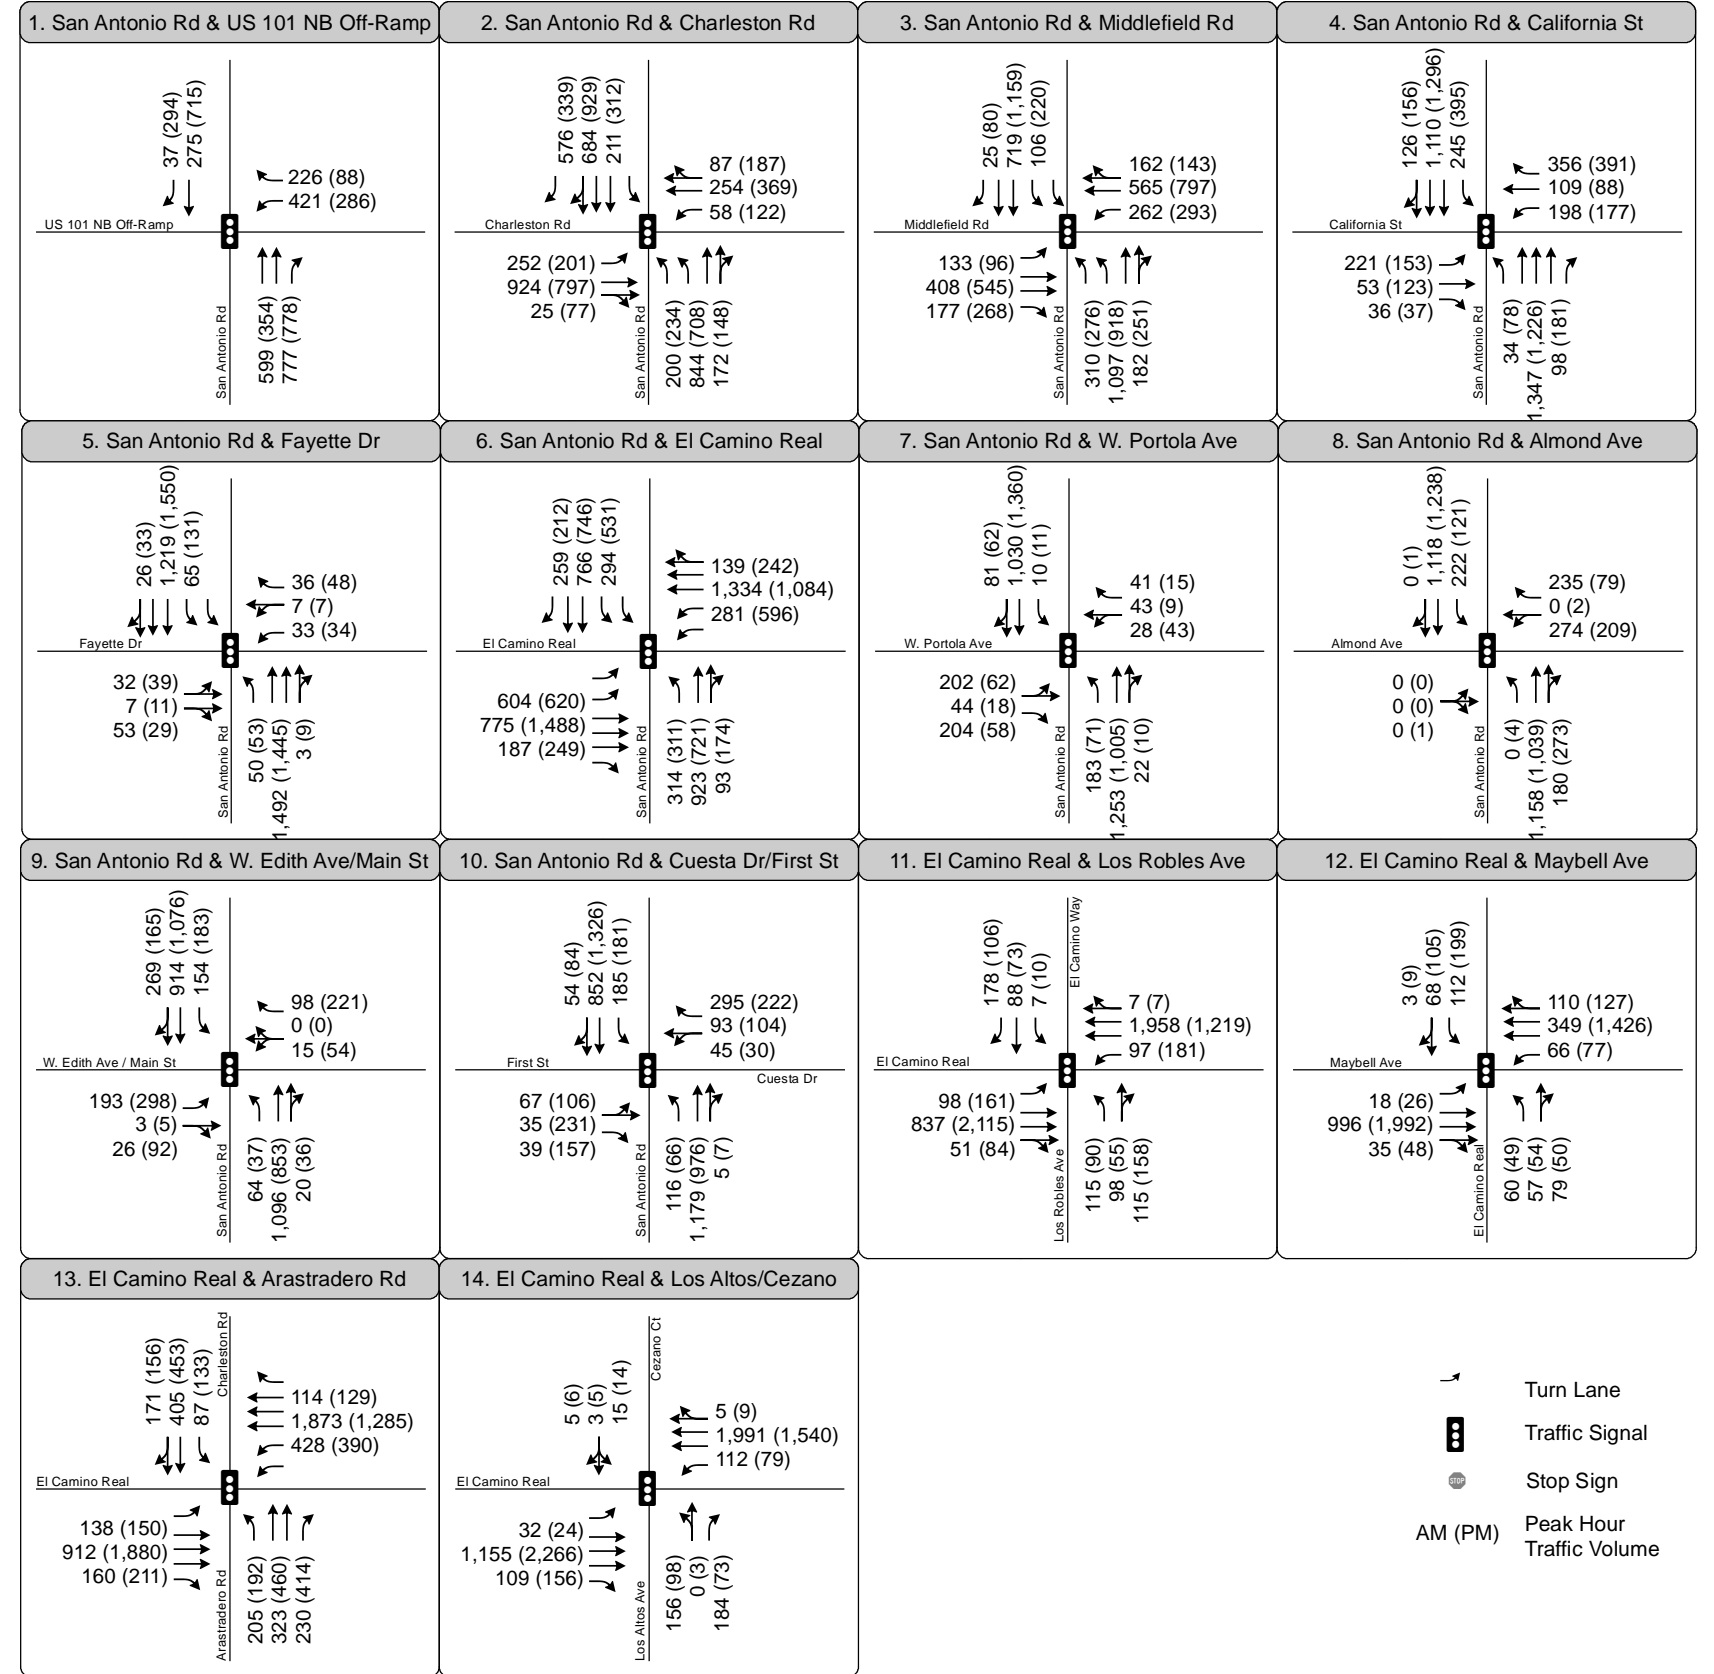

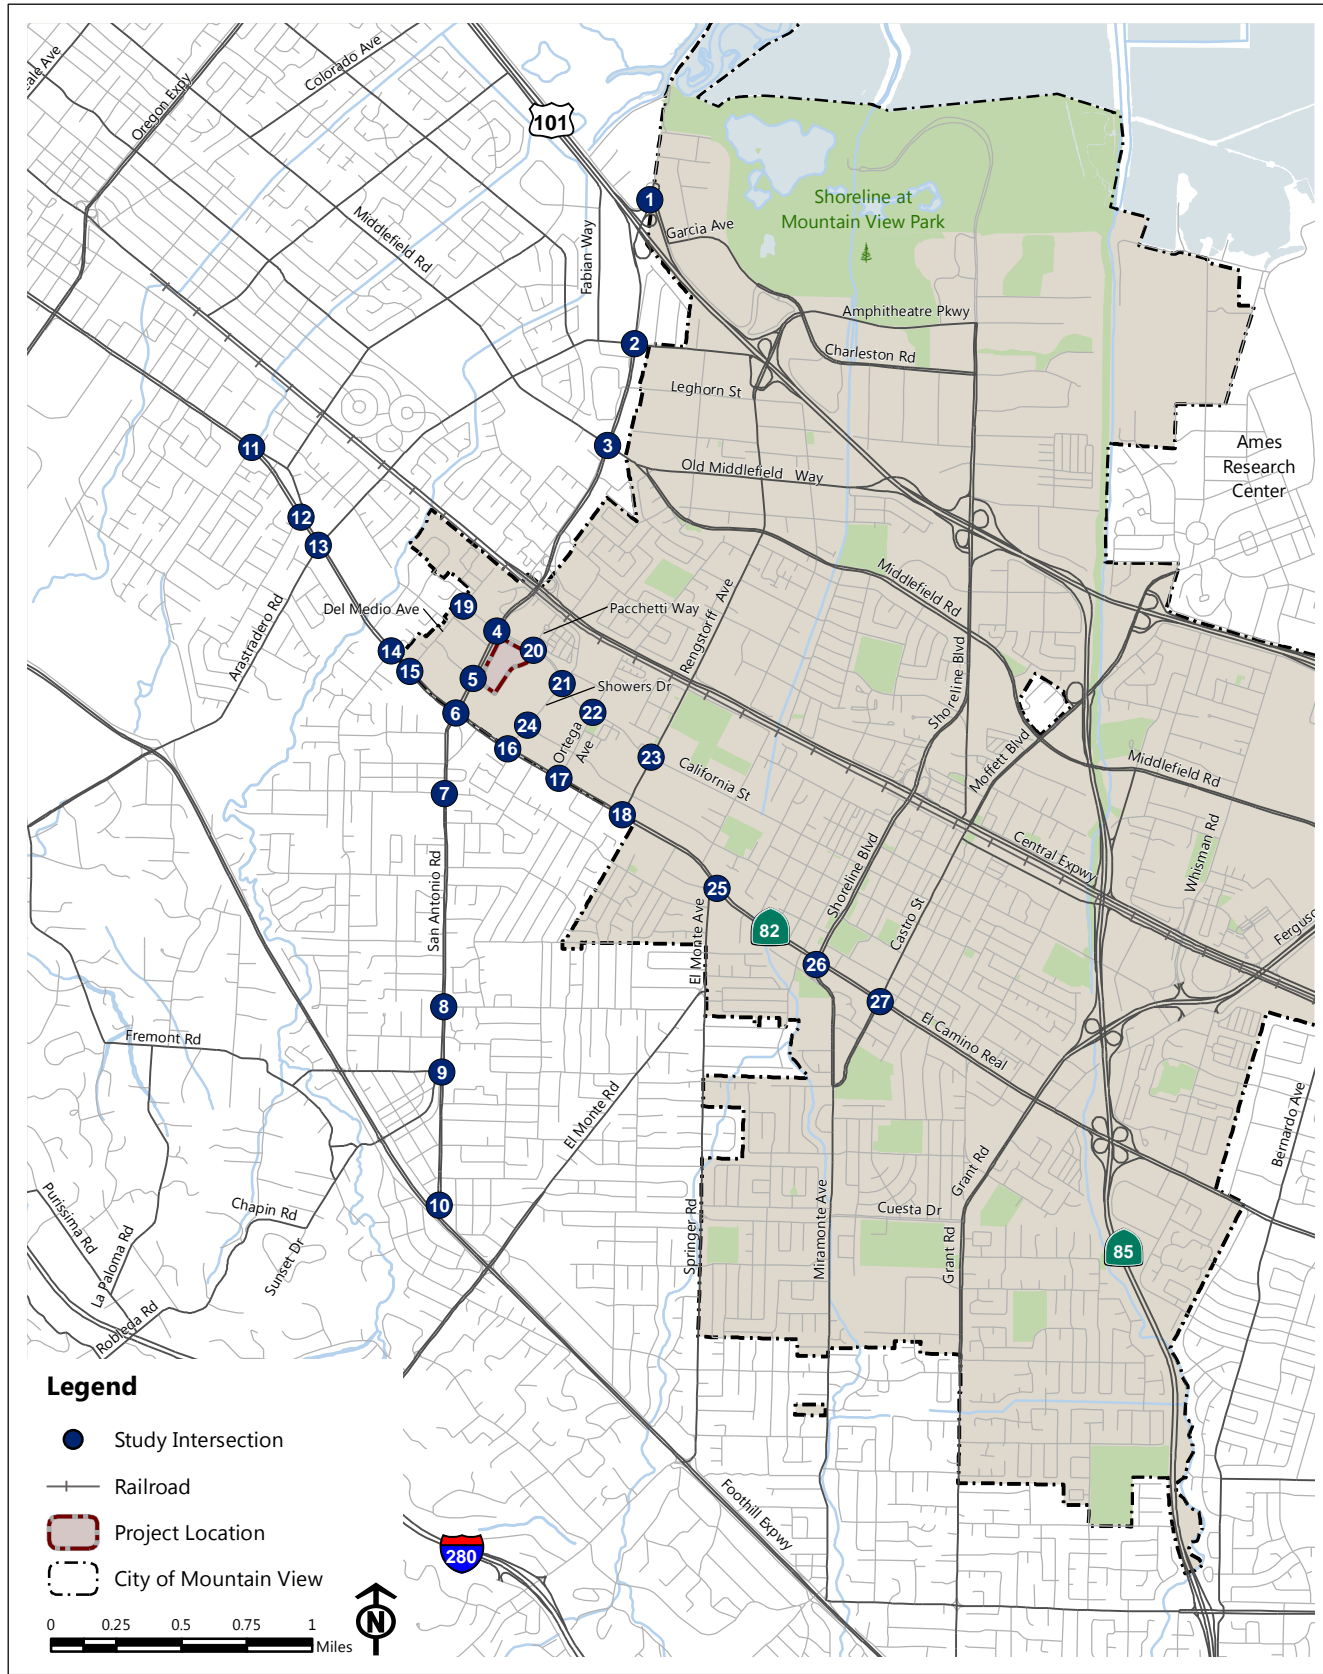

Projections of added traffic for Background Conditions were based on approved and not occupied development projects in the vicinity of the site. **Appendix E** includes a list of approved projects for the Cities of Mountain View, Palo Alto, and Los Altos.

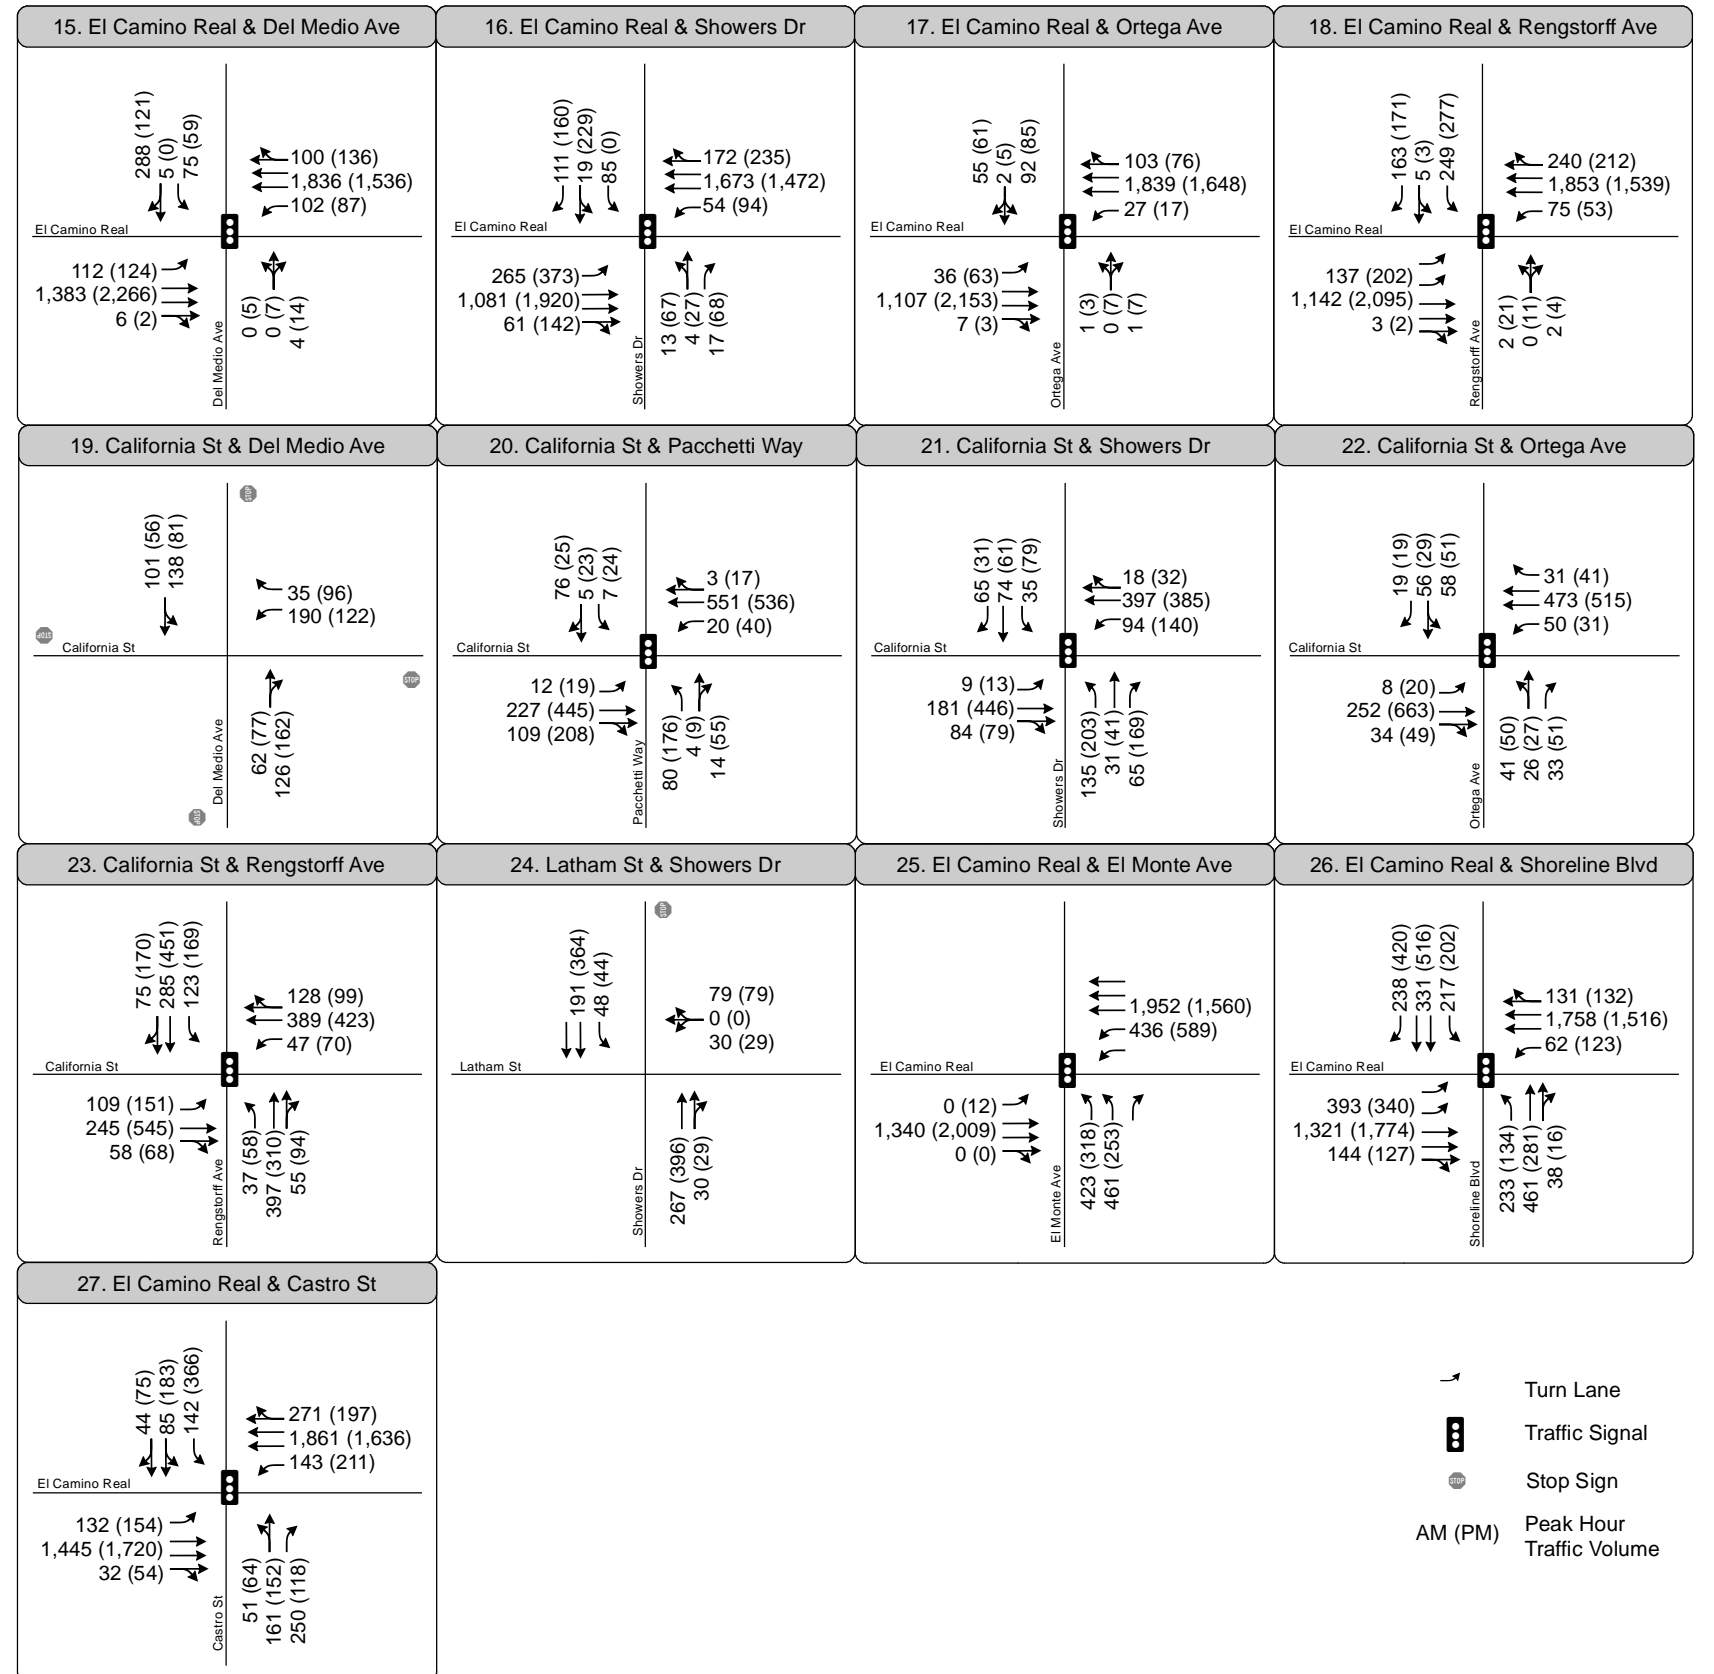

Trip generation estimates were based on information contained in the TIAs for the approved projects, where available. Where TIAs were not available, estimates were developed by applying appropriate trip generation rates and equations from the (ITE), *Trip Generation Manual*, 9th Edition.

The directions of approach and departure of Background trips were based on the project locations and the relative locations of complementary land uses, existing travel patterns in the area, and patterns used in project TIAs when available. Trips were then assigned to the roadway system based on the directions of approach and departure discussed in Chapter 3. The trips for each of the Background projects were added to the existing volumes to represent Background Conditions, as shown on **Figure 11**.

BACKGROUND ROADWAY IMPROVEMENTS

Per discussions with the City of Mountain View, there are no approved and funded roadway improvements within the study area. Therefore, the existing roadway network was used for the Background Conditions analysis.

BACKGROUND PLUS PROJECT INTERSECTION VOLUMES

Net new trips from the project presented in Chapter 3 were added to the Background Conditions to develop traffic volumes for Background Plus Project Conditions. The resulting volumes are shown on **Figure 12**.

BACKGROUND INTERSECTION LEVELS OF SERVICE

Table 11 presents the level of service calculation results for the study intersections under Background Conditions and Background Plus Project Conditions. Appendix B contains the corresponding calculation sheets.

The results of the LOS calculations indicate that all of the study intersections will operate at acceptable levels of service with the Project according to their designed LOS standard. The intersection of San Antonio Road and California Street operates at LOS E+ in the AM peak hour, though it is part of the San Antonio Center Planning Area, which has an LOS E threshold. The intersection of San Antonio Road and El Camino Real operates at LOS E in both the AM and PM peak hours, though it is a CMP designated intersection, which has an LOS threshold of E.

SIGNAL WARRANT ANALYSIS

The peak-hour signal warrant from the MUTCD was evaluated for the unsignalized intersections under both Background and Background Plus Project Conditions. The two unsignalized locations for this project are the intersections of California Street / Del Medio Avenue and Showers Drive / Latham Street. The results indicate that a traffic signal is not warranted at either of these locations based on the peak-hour warrant. Appendix C contains the peak-hour signal warrants. As shown in Table 11, both unsignalized intersections are operating at acceptable levels of service.

This analysis is intended to examine the general correlation between the planned level of future development and the need to install new traffic signals. The peak-hour signal warrant analysis should not serve as the only basis for deciding whether and when to install a traffic signal. To reach such a decision, the full set of warrants should be investigated based on a thorough study of traffic and roadway conditions by an experienced engineer. The decision to install a signal should not be based solely upon the warrants, since the installation of signals can lead to certain types of collisions. The responsible state or local agency, or the project sponsor (for private roads), should undertake regular monitoring of actual traffic conditions and accident data and timely re-evaluation of the full set of warrants in order to prioritize and program intersections for signalization.

INTERSECTION IMPACTS AND MITIGATION

Based on the impact criteria listed in Chapter 1, the results of the LOS calculations indicate that all of the study intersections still operate at acceptable levels of service in the Background Plus Project scenario. Therefore, no mitigation is required under this scenario.

BACKGROUND PLUS PROJECT FREEWAY LEVEL OF SERVICE

The proposed project does not add trips greater than one percent of the freeway segment capacity to any freeway segments already operating at LOS F; therefore, the project has a less-than-significant impact at the identified study freeway segments and no mitigation measures are required.

6. CUMULATIVE NEAR-TERM CONDITIONS

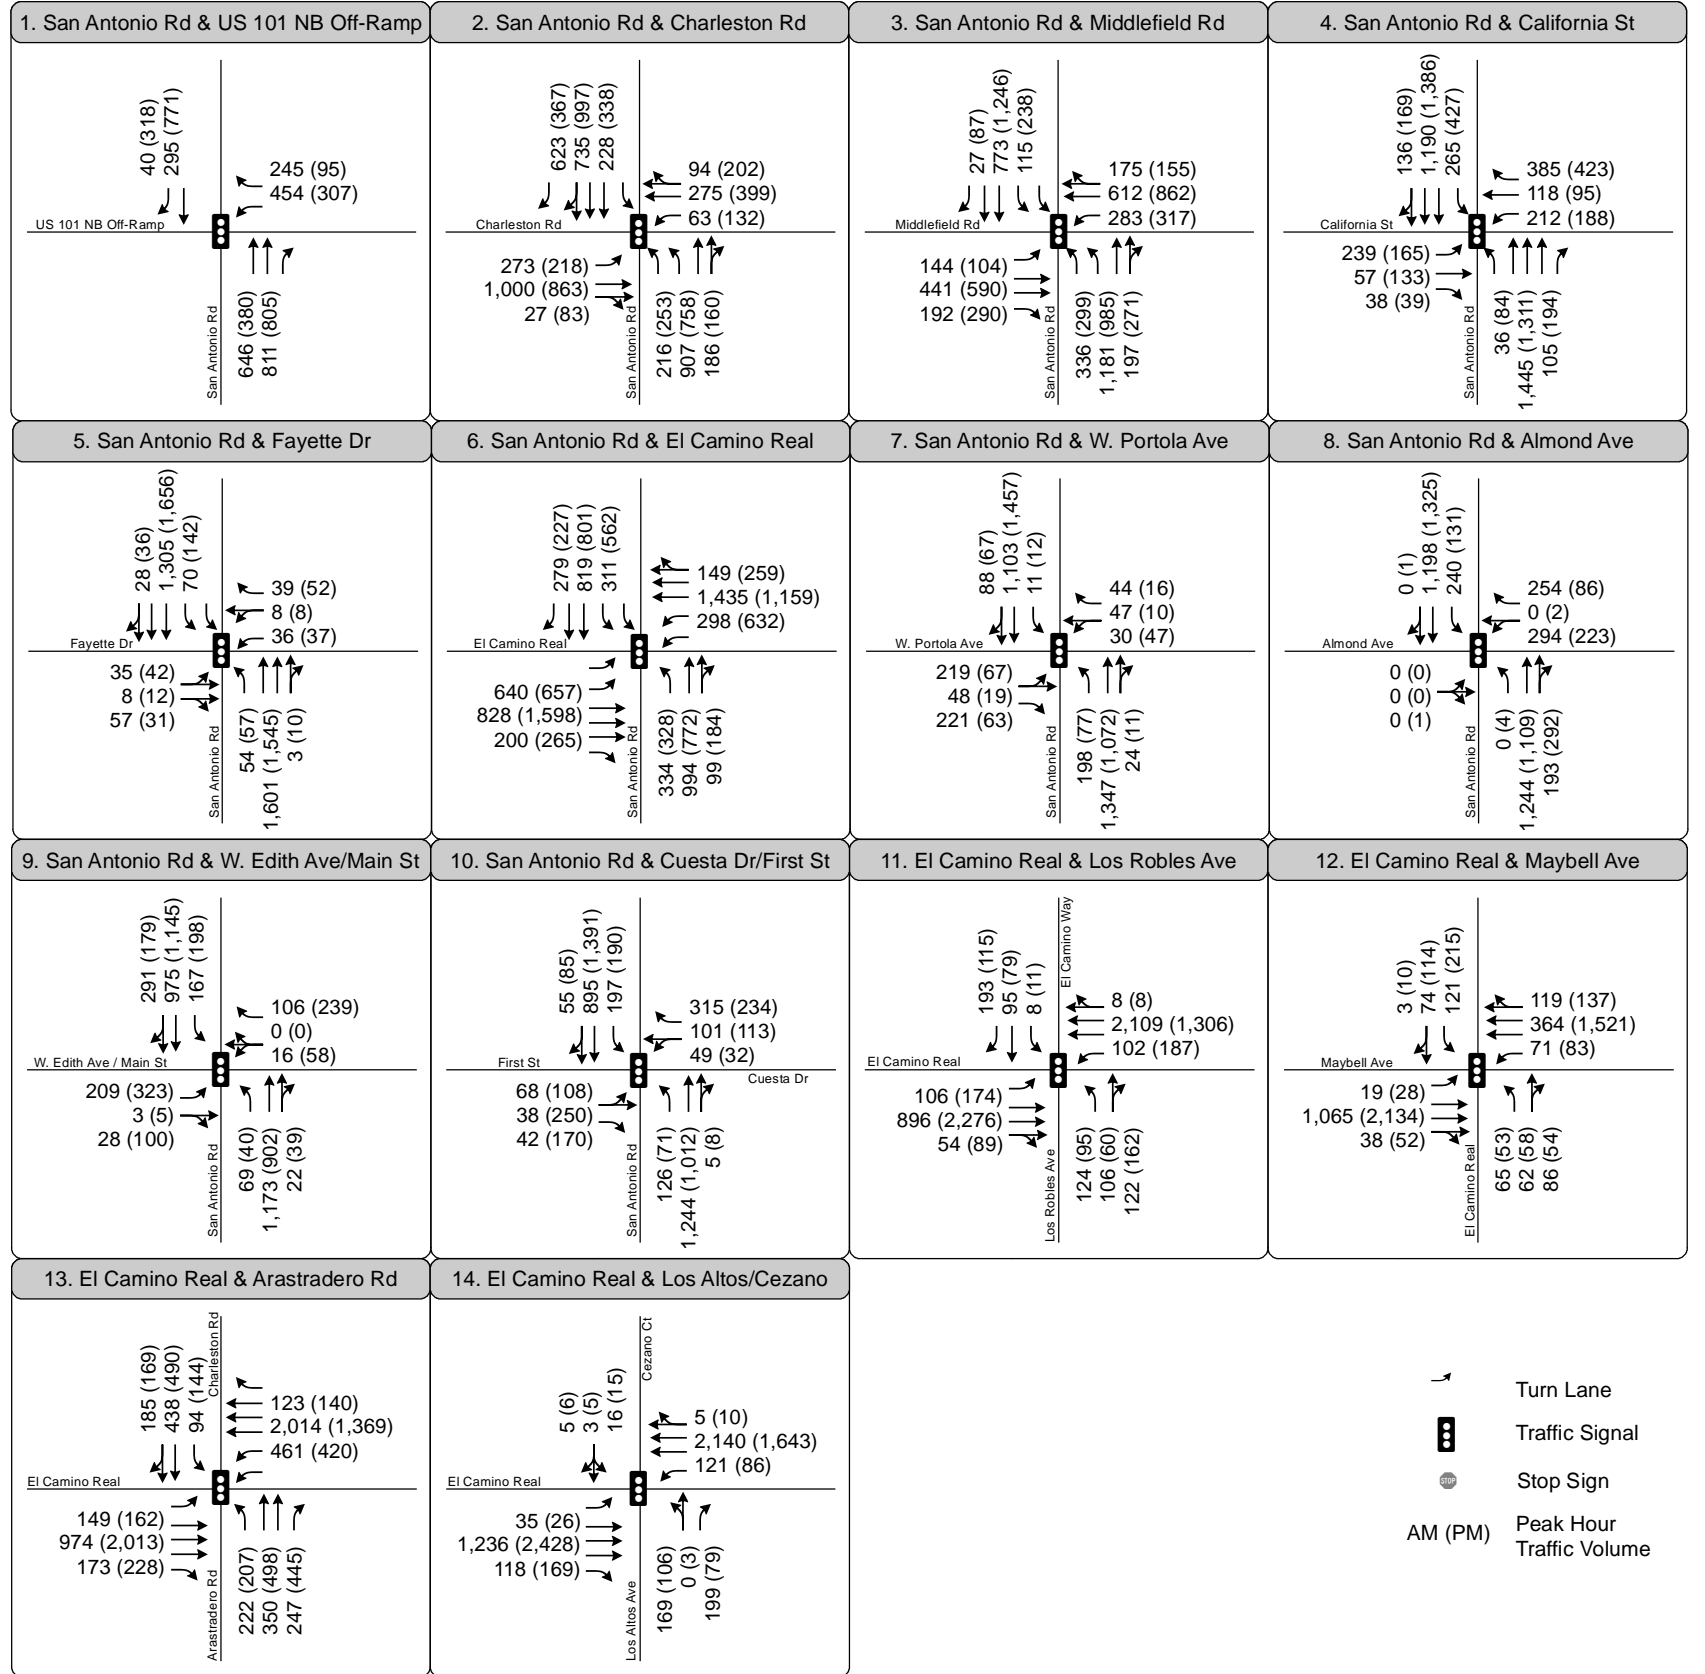

This chapter presents the results of the level of service calculations under Cumulative Near-Term Conditions with and without the Project. Cumulative Near-Term Conditions are defined as existing volumes plus traffic generated by all foreseen development projects that would affect the transportation system in the study area, including “approved but not yet built,” projects, as well as a growth factor to account for general growth in the area until occupancy of the Project. Cumulative Near-Term Plus Project Conditions are defined as Cumulative Near-Term Conditions plus traffic generated by the proposed project.

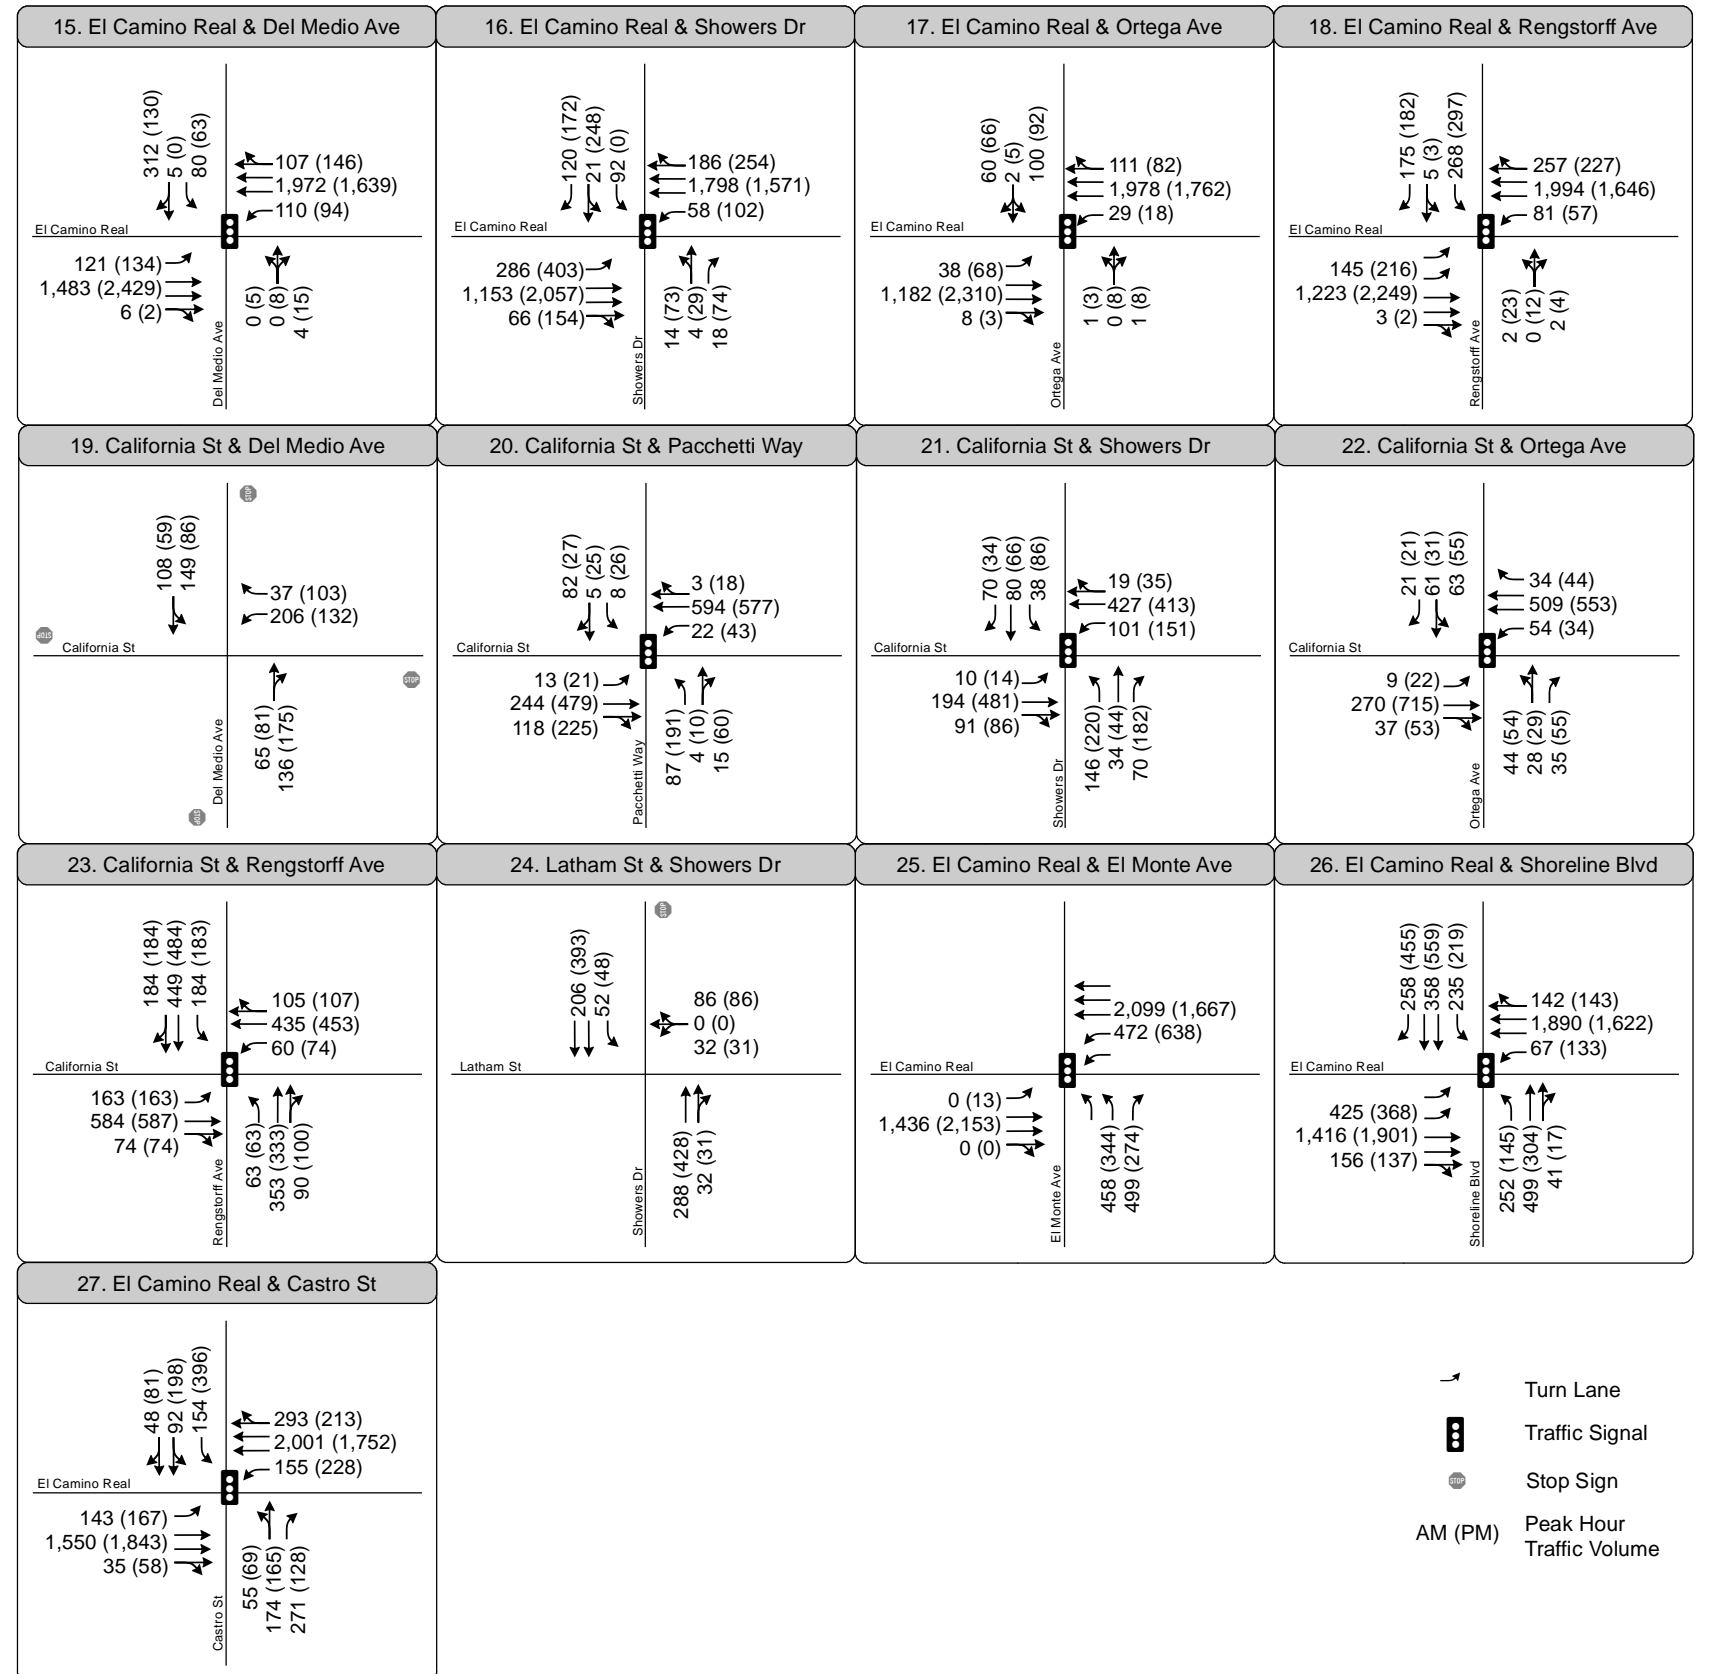

CUMULATIVE NEAR-TERM TRAFFIC VOLUMES

Traffic projections for Cumulative Near-Term Conditions include a growth factor to account for general growth in the area. Each movement at every intersection is anticipated to experience 2 percent growth per year, compounded annually. Existing vehicle count data were collected in 2013; the project is currently on schedule to be open in 2017, generating an additional 8.24 percent traffic. This growth was added to intersection volumes in the Background Conditions scenario. The resulting volumes representing Cumulative Near-Term Conditions are shown on **Figure 13**.

CUMULATIVE NEAR-TERM ROADWAY IMPROVEMENTS

Per discussions with the City of Mountain View, there are no approved and funded roadway improvements within the study area. Therefore, the existing roadway network was used for the Cumulative Near-Term analysis.

CUMULATIVE NEAR-TERM PLUS PROJECT VOLUMES

Net new trips from the proposed project were added to the Cumulative Near-Term traffic projections to develop traffic volumes for Cumulative Near-Term Plus Project Conditions. The resulting volumes are shown on **Figure 14**.

CUMULATIVE NEAR-TERM INTERSECTION LEVELS OF SERVICE

Table 12 presents the level of service calculations for the study intersections under Cumulative Near-Term Conditions and Cumulative Near-Term Plus Project Conditions. Appendix B contains the corresponding calculation sheets.

The results of the LOS calculations indicate that the majority of the study intersections will operate at acceptable levels of service according to their designed LOS standard. The only intersection that does not meet its respective LOS designation for the AM and/or PM peak hours under Cumulative Near-Term Plus Project Conditions is the intersection of San Antonio Road and El Camino Real in the PM peak hour.

The intersection of San Antonio Road and California Street operates at LOS E in AM and PM peak hours, though it is part of the San Antonio Center Planning Area, which has an LOS threshold of E.

SIGNAL WARRANT ANALYSIS

The peak-hour signal warrant from the MUTCD was evaluated for the unsignalized intersections under both Cumulative Near-Term and Cumulative Near-Term Plus Project Conditions. The two unsignalized locations for this project are the intersections of California Street / Del Medio Avenue and Showers Drive / Latham Street. The results indicate that a traffic signal is not warranted at either of these locations based on the peak-hour warrant. Appendix C contains the peak-hour signal warrants. As shown in Table 12, both unsignalized intersections are operating at acceptable levels of service.

This analysis is intended to examine the general correlation between the planned level of future development and the need to install new traffic signals. The peak-hour signal warrant analysis should not serve as the only basis for deciding whether and when to install a traffic signal. To reach such a decision, the full set of warrants should be investigated based on a thorough study of traffic and roadway conditions by an experienced engineer. The decision to install a signal should not be based solely upon the warrants, since the installation of signals can lead to certain types of collisions. The responsible state or local agency, or the project sponsor (for private roads), should undertake regular monitoring of actual traffic conditions and accident data and timely re-evaluation of the full set of warrants in order to prioritize and program intersections for signalization.

INTERSECTION IMPACTS AND MITIGATION

The results of the LOS calculations indicate that the majority of the study intersections will operate at acceptable levels of service according to their designed LOS standard. Only the intersection of San Antonio Road and El Camino Real does not meet its respective LOS designation for AM and/or PM under Cumulative Near-Term Plus Project Conditions.

The following measure is a draft recommendation to mitigate the impact. With the proposed mitigation measure, operations at the intersection would remain at LOS E in the AM peak hour and improve to LOS E- in the PM peak hour. The roadway configuration with construction of the proposed mitigation measure would be as follows:

Northbound San Antonio Road at El Camino Real

As prescribed in **Mitigation Measure TRA-MM-4**, intersection capacity improvement is required to improve intersection operation to an acceptable level of service. With this mitigation, the Project's contribution to this cumulative impact would be considered less than significant. However, because this improvement would require approval by Caltrans and VTA, the City cannot ensure the construction of this improvement at this time because it does not have any authority over those agencies' decisions. Without implementation of the proposed mitigation, the impact would be significant and unavoidable. Should the mitigation measure proposed not be feasible, a Deficiency Plan adhering to VTA standards should be developed.

Mitigation Measure TRA-MM-4: Pay a fair-share contribution towards the future improvement at the San Antonio Road/El Camino Real intersection

The applicant will pay for the improvement of the San Antonio Road and El Camino Real intersection and will be reimbursed by future developers based on their impact of their respective projects on the level of service at this intersection. The Project will contribute 16.80 percent to the intersection impacts and will ultimately pay only its proportionate share, after reimbursement by future developers contributing impacts to the intersection. The proposed mitigation measure for the San Antonio Road/El Camino Real intersection, located in the City of Los Altos, includes adding a second northbound left-turn lane, and will, if constructed, improve intersection operations to an acceptable level (LOS E or better).

An approximate 100-foot long left-turn pocket can be accommodated within the existing curb-to-curb width, although the median will have to be relocated. Signal poles, mast arms, and heads may need to be re-aligned or added with this change. Preliminary consultation with the City of Los Altos indicates that Los Altos accepts the need for the improvements to the intersection and would cooperate with the City of Mountain View and other agencies in ensuring it would be constructed. The final configuration of the improved intersection will require approval from the City of Mountain View, the City of Los Altos, VTA, and Caltrans to address the practical steps of implementing any improvements.

A more detailed operations and queuing analysis, using the Synchro/SimTraffic software program, will be conducted to more accurately evaluate the vehicle interactions along San Antonio Avenue from California Street to El Camino Real and to reflect the effects of the interconnected signals' potential vehicle queue impacts. This analysis will be conducted to evaluate this potential mitigation measure and to address traffic operational implications of the potential improvements farther to the north on San Antonio Road being designed by the project sponsor. This analysis will be completed once designs have been completed by the project sponsor.

Appendix F contains the corresponding LOS calculation sheets with the mitigation measure.

SAN ANTONIO ROAD AND CALIFORNIA STREET RE-CONFIGURATION TEST

The City asked for a test of a possible re-configuration for the southbound approach at the intersection of San Antonio Road and California Street. The re-configuration would convert one southbound through lane to a left-turn lane, so that the overall configuration of southbound San Antonio Road is as in the diagram below:

Southbound San Antonio Road at California Street

With the re-configuration, the intersection operates with less overall delay per vehicle during both peak hours under Cumulative Near-Term Plus Project Conditions (LOS D- in the AM peak hour and LOS E+ in the PM peak hour). The signal phasing may need to change if the northbound and southbound left-turn phases cannot run simultaneously due to spacing issues, though based on the aerial imagery and a preliminary AutoTurn test, that does not appear to be the case. Signal heads may need to be re-aligned or added with this

change. Again, a more detailed operations and queuing analysis using the Synchro/SimTraffic software program will be conducted to evaluate this change and other potential roadway improvements being designed by the project sponsor. This analysis will be conducted when the improvement designs are completed. A conceptual drawing of this mitigation measure is shown in **Appendix H**.

CUMULATIVE NEAR-TERM PLUS PROJECT FREEWAY LEVEL OF SERVICE

The proposed project does not add trips greater than one percent of the freeway segment capacity to any freeway segments already operating at LOS F; therefore, the project has a less-than-significant impact at the identified study freeway segments and no mitigation measures are required.

7. SITE ACCESS AND ON-SITE CIRCULATION

This chapter analyzes site access and internal circulation for vehicles, pedestrians, bicycles, and transit vehicles based on the site plan presented on Figure 2. Pedestrian, bicycle, and transit impacts are addressed. A parking assessment was also conducted. The proposed site plan indicates the location of the project driveways and the internal circulation system that supports auto, pedestrian, and bicycle traffic. Future site access to/from each building within the site and the internal circulation within the project site are discussed below.

VEHICLE SITE ACCESS AND CIRCULATION

Direct access to the Project site will be provided via three driveways on San Antonio Road, three driveways on Pacchetti Way, and one driveway on California Street. The driveways on San Antonio Road and California Street are right-in, right-out only driveways, while the driveways on Pacchetti Way are full-access driveways. Vehicles approaching from southbound San Antonio Road can either turn left at California Street to access the Project site, or they can choose to U-turn at Fayette Drive and use the San Antonio Road driveways (or turn left at Fayette Street and drive through a portion of the Phase I site). There are two southbound left-turn pockets at this intersection, both of which are approximately 400 feet long, which would provide enough storage for the additional vehicles the Project generates, based on preliminary traffic operations analysis. This will be studied in more detail with the additional the Synchro/SimTraffic operations and queuing analysis mentioned in the Cumulative Near-Term Conditions impact and mitigation analysis discussion.

The internal circulation for the proposed underground parking garage was reviewed for issues related to queuing, safety, dead-end aisles, and parking spaces that may be difficult to maneuver in and out of. The following recommendations are based on the submittal set from RTKL dated August 13, 2013, created for the Development Review Committee Meeting, which was found on the City's website. A complete set of plans, including detailed layout of all levels of each parking structure, should be reviewed before final submittal.

All circulation aisles should accommodate two-way travel (most do) and all of the proposed parking spaces should be perpendicular (most are). Drive aisles should have a minimum width of 24 feet. For any dead-end aisles in the basement, the drive aisle should extend 8 feet beyond the last parking space to allow cars to maneuver in and out of the last parking space of each aisle. The parking spaces nearest to the elevators in parking garages should be designated as the accessible parking spaces.

Service vehicles have access to the Project site via San Antonio Road, California Street, and Pacchetti Way. These vehicles will circulate through the surface lot to the various trash enclosures and service entrances. The loading dock next to the northern driveway on Pacchetti Way shows different alignments on different sheets, though there does not appear to be a driveway apron for service vehicles to back up to the building. The

loading area should be situated such that the back end of service vehicles are parallel to the loading docks, which is not shown on Site Plan A1.01.

The four on-grade parking spaces adjacent to the northern wall of the proposed parking garage on Parcel 5 should be considered for removal. The proximity to the wall would make for difficult maneuvering into and out of the spaces, and sight distance backing out of spaces could be an issue. The on-grade parking spaces adjacent to the southern wall already have this design.

Additionally, the driveway shown on Parcel 4 near the hotel is narrow entering the lobby area. The throat of the driveway should be wider and the curb radius should be increased to accommodate emergency vehicles access to the lobby area.

VEHICLE PARKING

The completed Project will provide a total of 2,559 parking spaces for employees, visitors, and customers, 89 of which will be accessible spaces. **Table 13** outlines the vehicle parking requirements by land use type according to Sections 36.37.040 (parking supply) and 36.37.060 (accessible parking supply) of the City's Municipal Code. The proposed parking supply is 181 spaces, or 7 percent, below the City requirements. Given that the office space (accounting for 1,309 parking spaces) and the cinema (accounting for 489 parking spaces) are complementary uses, some of the parking spaces could be shared for both uses. Additionally, with a 30 percent TDM goal, the office parking supply could be reduced (30 percent of 1,309 total office parking spaces is 393 potentially unused parking spaces). Therefore, the Project's parking impact is less-than-significant. Without these allowances, the site plan should be revised to indicate the total number of spaces provided, for both general use parking spaces and accessible parking spaces.

Accessible parking spaces should comply in all respects with the requirements of the California Code of Regulations (State Building Code) or Federal law, where such requirements prevail over State law. The bicycle parking requirements are discussed in a later section.

TABLE 13: VEHICLE PARKING REQUIREMENTS

Land Use	Vehicle Parking Ratio ¹	Size (Gross)	Required Vehicle Parking Supply		
			Regular	Accessible ²	Total
Hotel	1 Stall/1 Room, + 1 Stall/2 Employees	167 Rooms	186	6	192
Retail	1 Stall/180 s.f.	54,186 s.f.	293	8	301
Office	1 Stall/300 s.f.	392,853 s.f.	1,286	23	1,309
Commercial	1 Stall/300 s.f.	28,502 s.f.	91	4	95
Restaurant	1 Stall/100 s.f.	35,358 s.f.	346	8	354
Cinema	1 Stall/3.5 Seats	1,710 seats	480	9	489
Total Project Vehicle Parking Spaces Required			2,682	58	2,740

Notes:

1. Parking Requirements by Land Use, Section 36.37.040.B, City of Mountain View Municipal Code.
2. Handicapped Parking Requirements, Section 36.37.060, City of Mountain View Municipal Code and Section 1129 B of the California Code of Regulations Title 24, Part 2 (Uniform Building Code).

Parking Management

To ensure that the proposed garages are evenly and efficiently utilized, and that the most convenient spaces are available for customers, the project applicant should consider creating a parking management program. Such a program could assign office parking and retail/restaurant/cinema/hotel employee parking among the two garages. Parking garage access can be re-assessed as the tenants begin to fill the buildings. All surface parking spaces should have time restrictions to ensure that they are available for customers and not used by employees.

TRANSPORTATION DEMAND MANAGEMENT PROGRAM

The City of Mountain View is requiring the Project to have a TDM program that reduces peak hour vehicle trips generated by the office space to 449 AM peak hour trips and 440 PM peak hour trips (approximately a 30 percent reduction). This is a fairly aggressive goal. Therefore the TDM program needs to provide detailed descriptions of the variety of TDM strategies to be implemented on the site, the party responsible for each measure (e.g. building management or individual employers), the monitoring process, and penalties for non-compliance.

The following is a partial list of TDM measures aimed at reducing both the number of vehicle trips and parking demand:

- Subsidized transit tickets for all feasible transit modes (e.g. VTA bus and Caltrain).
- Preferential carpool and vanpool parking.
- On-site commuter assistance center offering one-stop shopping for transit and commute alternative information.
- High-speed internet connections in employee homes to facilitate telecommuting.
- Alternative work schedules (staggered start times, flexible work hours, and/or compressed work week program).
- Other on-site amenities that encourage workers to leave cars at home.
- Bicycle parking including lockers, racks, and cages, as well as showers, changing rooms, and clothing lockers.
- Bicycle and pedestrian “cash” payments.
- A guaranteed ride home program, or vanpool implementation support.
- Parking “cash out” program where employees are offered a cash incentive not to drive their car to the site.
- Restricted parking spaces to ensure office parking spaces are used for employees only, and vice versa.

The TDM program should include an annual review of employee commuting patterns and characteristics, to be submitted to City staff for review, as part of the monitoring process. This information would be used to modify the TDM strategies to increase the program’s effectiveness and its ability to meet vehicle trip reduction requirement. The office peak-hour vehicle trip monitoring should be done by an independent evaluator.

It will be important for office employees to only park in designated areas so that their trips can be monitored. Therefore it is recommended that all surface spaces on the site have time limits of one to two hours and that all non-office parking spaces in the southern garage have a time limit of four hours. This will help to prohibit office employees from parking in those locations.

PEDESTRIAN, BICYCLE, AND TRANSIT IMPACTS AND MITIGATION

This section of the report addresses both off-site and on-site facilities that provide pedestrian and bicycle access and circulation for the project.

OFF-SITE PEDESTRIAN FACILITY EVALUATION

Most signalized intersections within one-quarter mile of the project site have crosswalks and pedestrian signals on all four legs. In addition, there is a mid-block, unsignalized crosswalk at Miller Avenue that crosses San Antonio Road near the intersection of San Antonio Road and California Street. Though the Project would generate vehicles that would cross existing pedestrian facilities on a regular basis, the existing facilities are designed adequately, making any impact less than significant.

During both the morning and evening peak periods, large pedestrian volumes are anticipated to cross the intersection of California Street and Pacchetti Way due to office employees going to Caltrain from the Project site, and vice versa. Therefore, to accommodate these high pedestrian volumes, it is recommended that the pedestrian crossings be enhanced with high visibility crosswalks, corner bulbouts and signage. These impacts are potentially significant, given that the Project would not provide adequate pedestrian facilities to connect to the area circulation system.

Impacts associated with widening intersections for vehicle movements would include removal of trees, relocation of utilities, lengthening of crosswalks, and/or modification of signal phasing that could increase the crossing distance/time for pedestrians and bicyclists. Intersection improvements resulting in these secondary impacts have the potential to reduce travel demand for active transportation (e.g., walking and bicycling) and transit modes. No widening is currently proposed, though re-striping and other signal modifications could lead to increasing the crossing and/or waiting times for pedestrians and bicyclists at intersections. Any impacts to the off-site pedestrian facilities are projected to be less than significant.

ON-SITE PEDESTRIAN FACILITY EVALUATION

The Project is expected to generate demand for sidewalks to allow pedestrians to access nearby bus stops, the Caltrain station platforms, and adjacent land uses. To accommodate all users of the street system and provide a complete and connected pedestrian facility between the project site and transit service, a sidewalk with a minimum width of 8 feet should be installed along all Project frontages.

To accommodate pedestrian volumes within the Project site, it is recommended that the pedestrian crossings be enhanced with high visibility crosswalks, corner bulbouts and signage. These improvements

should meet ADA requirements and include direct travel paths from the southwest corner of California Street and Pacchetti Way to provide access to the Caltrain station.

The proposed sidewalks on the north side of Parcel 4 and the south side of Parcel 6 appear to be narrow. A sidewalk with a minimum width of 8 feet should be installed along all building frontages.

These impacts are potentially significant, given that the Project would not provide adequate pedestrian facilities to connect to the area circulation system.

BICYCLE ACCESS EVALUATION

The Project does not conflict with existing or planned bicycle facilities, and no modifications to the off-site bicycle facilities are recommended. The Project will increase bicycle demand and should ensure appropriate bicycle accommodations are provided for the employees and visitors and are accessible from the Caltrain station and nearest bicycle facilities (e.g., San Antonio Road, California Street, and Pacchetti Way, as well as the southern border of the Project). According to Section 36.37.040.B of the City's Municipal Code, the project is required to provide 131 bicycle parking spaces. **Table 14** outlines the vehicle parking requirements by land use type. These spaces should be conveniently located to building entrances for guests and employees. The applicant should ensure the following measures are integrated into the final site design:

- Class I long-term bicycle parking such as lockers or a secured room be provided for employee use.
- Class II short-term bicycle parking racks such as an inverted U-style bicycle parking rack should be provided.

As recommended by the VTA, the bicycle parking spaces should be split such that 75 percent are Class I facilities and 25 percent are Class II facilities.

TABLE 14: BICYCLE PARKING REQUIREMENTS

Land Use	Bicycle Parking Ratio	Size (Gross) (S.F.)	Required Bicycle Parking Supply ¹		
			Long-term (Class I)	Short-term (Class II)	Total
Hotel	1 Stall/50 Rooms, + 1 Stall/100 Employees	167 Rooms	3	1	4
Retail	1 Stall/3,600 s.f.	54,186 s.f.	11	4	15
Office	1 Stall/6,000 s.f.	392,853 s.f.	49	16	65
Commercial	1 Stall/6,000 s.f.	28,502 s.f.	4	1	5

Notes:

1. Parking Requirements by Land Use, Section 36.37.040.B, City of Mountain View Municipal Code.

These impacts are potentially significant, given that the Project would not provide adequate bicycle facilities to connect to the area circulation system.

Again, no widening is currently proposed, though re-striping and other signal modifications could lead to increasing the crossing and/or waiting times for pedestrians and bicyclists at intersections. Any impacts to the off-site bicycle facilities are projected to be less than significant.

TRANSIT ACCESS

The project is located adjacent to existing transit lines and bus stops operating along Caltrain rail, San Antonio Road, California Street, Showers Drive, and El Camino Real. Although the increase in passenger demand may not exceed capacity, enhancements to existing service are recommended to encourage transit use. The City can support transit usage by encouraging amenities such as seating, lighting, and signage at bus stops to increase rider comfort and safety.

TRANSIT SERVICE

Potential Project impacts associated with increased vehicle delay at intersections includes an increase transit vehicle delay because transit vehicles operate in mixed-flow lanes with other vehicles in the study area. The vehicle intersection capacity improvements would also benefit transit vehicles. The TDM trip reductions remove 193 AM peak hour trips and 188 PM peak hour trips. VTA routes 22 and 522 are near or over capacity, though the new transit trips generated by the Project should not affect these services.

8. VEHICLE MILES TRAVELED (VMT) ESTIMATES

Transportation is a major contributor to greenhouse gas emissions and a direct result of population and employment growth, which generates vehicle trips to move goods, provide public services, and connect people with work, school, shopping, and other activities. Growth in travel (especially vehicle travel) is due in large part to urban development patterns (i.e., the built environment).

A performance measure used to quantify the amount of travel is vehicle miles traveled (VMT). VMT is also an important input to GHG analysis since the amount of travel and conditions under which the travel occurs directly relate to how much fuel vehicles burn. One combusted gallon of gas from a vehicle is equal to approximately 24 pounds of carbon dioxide. Given today's average vehicle fuel mileage (i.e., approximately 22 miles per gallon), one mile of travel equates to about one pound of carbon dioxide. As a result, increases in VMT directly cause increases in greenhouse gas emissions and air pollution.

VMT measurement has one primary limitation: it is not directly observed and therefore cannot be directly measured. It is calculated based on the number of cars multiplied by the distance traveled by each car. The amount of VMT can be obtained through extensive surveys of residents, visitors, and employees, or using a validated travel demand model that estimates vehicle demand. VMT estimates derived from travel demand forecasting (TDF) models are dependent on the level of detail in the network and other variables related to vehicle movement through the network. The volume of traffic and distance travelled depends on land use types, density/intensity, and patterns as well as the supporting transportation system.

The City's TDF model was used to develop citywide daily VMT estimates for the Project. The simplest calculation of VMT is the number of cars multiplied by the distance traveled by each car. Based on the state of the practice technique for determining the VMT estimates for municipalities, the following assumptions were used to allocate VMT to the City of Mountain View:

- Internal-internal (II): All daily trips made entirely within the Mountain View city limits.
- One-half of internal-external (IX): One-half of daily trips with an origin within Mountain View city limit and destination outside of Mountain View. This assumes that Mountain View shares half the responsibility for trips traveling to other municipalities.
- One-half of external-internal (XI): One-half of daily trips with an origin outside of Mountain View city limit and destination within Mountain View. Similar to the IX trips, Mountain View shares the responsibility of trips traveling from other municipalities.
- External-external (XX): Trips through the city are not included. This approach is consistent with the concept used for the IX and XI trips. Therefore, the XX VMT would be assigned to other municipalities, such as Sunnyvale, Los Altos, and Palo Alto.

This method is referred to as the Origin-Destination method and is consistent with the Regional Targets Advisory Committee (RTAC) recommendation to the California Transportation Commission (CTC) presented in the report Recommendations of the Regional Targets Advisory Committee (RTAC) Pursuant to Senate Bill 375 (Regional Targets Advisory Committee, 2009). The average VMT per vehicle trip from the model was used for each non-office trip. Office trip VMT estimates were calculated based on the direction from which each trip came. Estimated daily VMT associated with the Project is shown in Table 15, below. Total VMT is projected to increase by 36,120 vehicle-miles with the Project, or about 5.3 vehicle miles traveled per Project trip⁴.

TABLE 15: VEHICLE MILES TRAVELED (VMT) ESTIMATES

Speed Bin (mph)	Project Contribution (Daily VMT)	Percentage by Bin
0-7.49	+7,500	20.77%
7.5-12.49	+4,210	11.66%
12.5-17.49	+3,570	9.87%
17.5-22.49	+4,100	11.34%
22.5-27.49	+5,980	16.57%
27.5-32.49	+6,890	19.06%
32.5-37.49	+1,690	4.69%
37.5-42.49	+600	1.66%
42.5-47.49	+470	1.31%
47.5-52.49	+470	1.29%
52.5-57.49	+290	0.81%
57.5-62.49	+210	0.57%
62.5-67.49	+140	0.40%
Total VMT	+36,120	100.0%

Source: Fehr & Peers, November 2013.

⁴ The project generates an estimated 6,805 daily trips (Table 3). Thus, 36,120 VMT / 6,805 daily trips = 5.3 vehicle miles traveled per trip.

SIGNAL WARRANT DISCLAIMER

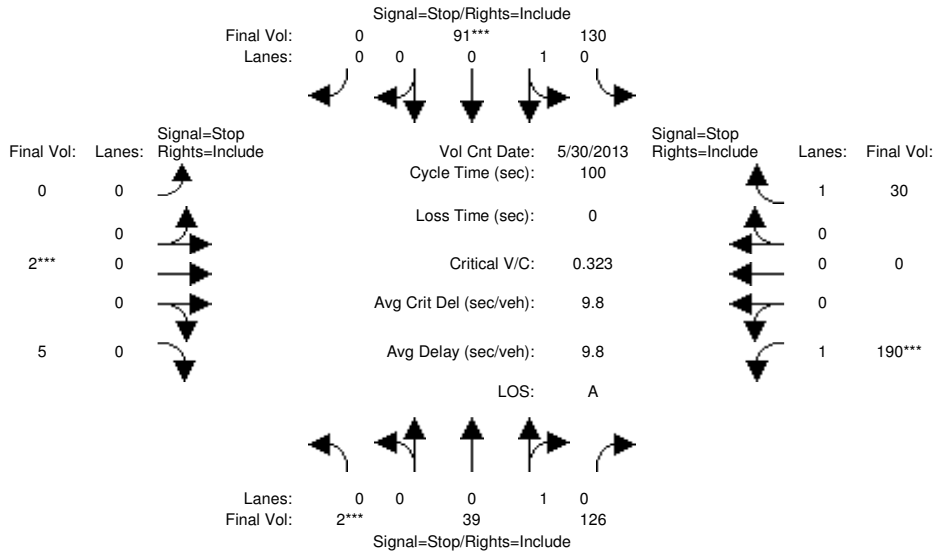

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

ApproachDel:	xxxxxx	xxxxxx	xxxxxx	10.7

```

Approach[westbound][lanes=1][control=Stop Sign]
Signal Warrant Rule #1: [vehicle-hours=0.3]
    FAIL - Vehicle-hours less than 4 for one lane approach.
Signal Warrant Rule #2: [approach volume=109]
    SUCCEED - Approach volume greater than or equal to 100 for one lane approach.
Signal Warrant Rule #3: [approach count=3][total volume=632]
    FAIL - Total volume less than 650 for intersection
        with less than four approaches.
    
```

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Major Street Volume:	311			
Minor Approach Volume:	210			
Minor Approach Volume Threshold:	660			

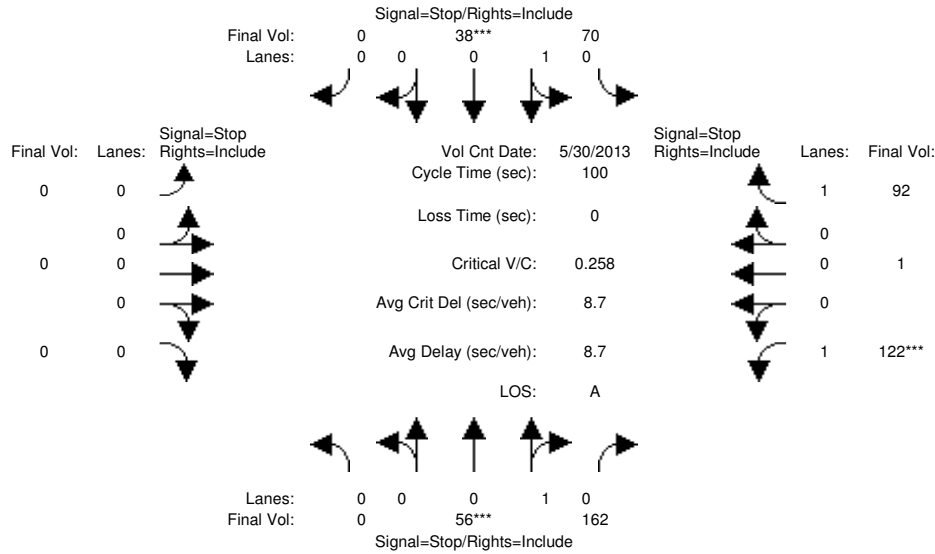

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Peak Hour Delay Signal Warrant Report

Intersection #24 Latham Street / Showers Drive

Future Volume Alternative: Peak Hour Warrant NOT Met

Approach:	North Bound	South Bound	East Bound	West Bound
Movement:	L - T - R	L - T - R	L - T - R	L - T - R
Control:	Uncontrolled	Uncontrolled	Stop Sign	Stop Sign
Lanes:	0 0 1 1 0	1 0 2 0 0	0 0 0 0 0	0 0 1! 0 0
Initial Vol:	0 389 29	44 354 0	0 0 0 0	29 0 79
ApproachDel:	xxxxxx	xxxxxx	xxxxxx	12.0

Approach[westbound][lanes=1][control=Stop Sign]
 Signal Warrant Rule #1: [vehicle-hours=0.4]
 FAIL - Vehicle-hours less than 4 for one lane approach.
 Signal Warrant Rule #2: [approach volume=108]
 SUCCEED - Approach volume greater than or equal to 100 for one lane approach.
 Signal Warrant Rule #3: [approach count=3][total volume=924]
 SUCCEED - Total volume greater than or equal to 650 for intersection with less than four approaches.

 SIGNAL WARRANT DISCLAIMER
 This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Major Street Volume:	429			
Minor Approach Volume:	225			
Minor Approach Volume Threshold:	559			

SIGNAL WARRANT DISCLAIMER

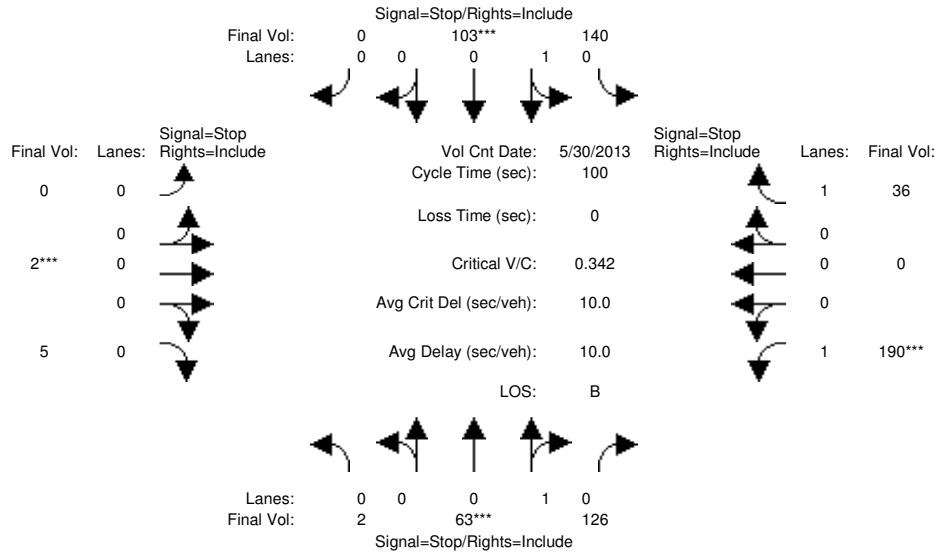

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Approach[westbound][lanes=1][control=Stop Sign]
Signal Warrant Rule #1: [vehicle-hours=0.3]
    FAIL - Vehicle-hours less than 4 for one lane approach.
Signal Warrant Rule #2: [approach volume=109]
    SUCCEED - Approach volume greater than or equal to 100 for one lane approach.
Signal Warrant Rule #3: [approach count=3][total volume=645]
    FAIL - Total volume less than 650 for intersection
        with less than four approaches.
    
```

 SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

SIGNAL WARRANT DISCLAIMER

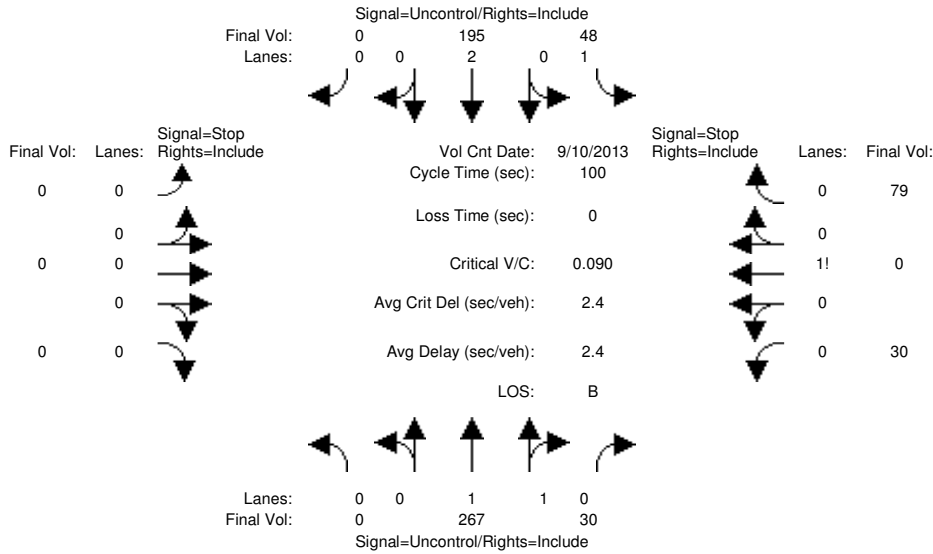

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

 Peak Hour Volume Signal Warrant Report [Urban]

 Intersection #19 California St / Del Medio Ave

 Future Volume Alternative: Peak Hour Warrant NOT Met

Approach:	North Bound	South Bound	East Bound	West Bound
Movement:	L - T - R	L - T - R	L - T - R	L - T - R
Control:	Stop Sign	Stop Sign	Stop Sign	Stop Sign
Lanes:	0 0 0 1 0	0 1 0 0 0	0 0 0 0 0	0 1 0 1 0
Initial Vol:	0 77 162	81 56 0	0 0 0 0	122 1 96
Major Street Volume:	376			
Minor Approach Volume:	219			
Minor Approach Volume Threshold:	600			

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

 Peak Hour Volume Signal Warrant Report [Urban]

 Intersection #19 California St / Del Medio Ave

 Future Volume Alternative: Peak Hour Warrant NOT Met

Approach:	North Bound	South Bound	East Bound	West Bound
Movement:	L - T - R	L - T - R	L - T - R	L - T - R
Control:	Stop Sign	Stop Sign	Stop Sign	Stop Sign
Lanes:	0 0 0 1 0	0 1 0 0 0	0 0 0 0 0	0 1 0 1 0
Initial Vol:	0 82 162	86 61 0	0 0 0 0	122 1 101
Major Street Volume:	391			
Minor Approach Volume:	224			
Minor Approach Volume Threshold:	588			

SIGNAL WARRANT DISCLAIMER

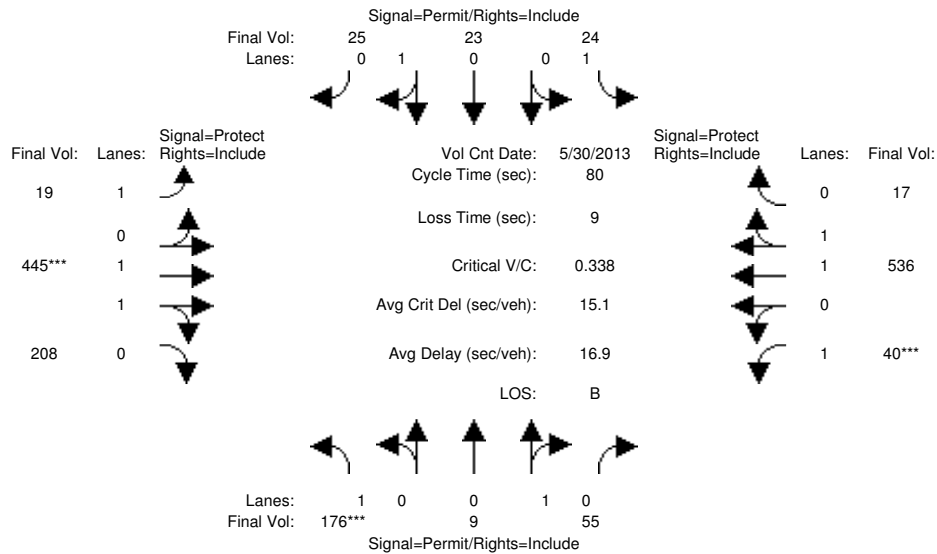

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Approach[westbound][lanes=1][control=Stop Sign]
 Signal Warrant Rule #1: [vehicle-hours=0.4]
 FAIL - Vehicle-hours less than 4 for one lane approach.
 Signal Warrant Rule #2: [approach volume=108]
 SUCCEED - Approach volume greater than or equal to 100 for one lane approach.
 Signal Warrant Rule #3: [approach count=3][total volume=941]
 SUCCEED - Total volume greater than or equal to 650 for intersection with less than four approaches.

 SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

 This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.
 Peak Hour Volume Signal Warrant Report [Urban]

 Intersection #24 Latham Street / Showers Drive

Major Street Volume:	461											
Minor Approach Volume:	243											
Minor Approach Volume Threshold:	536											

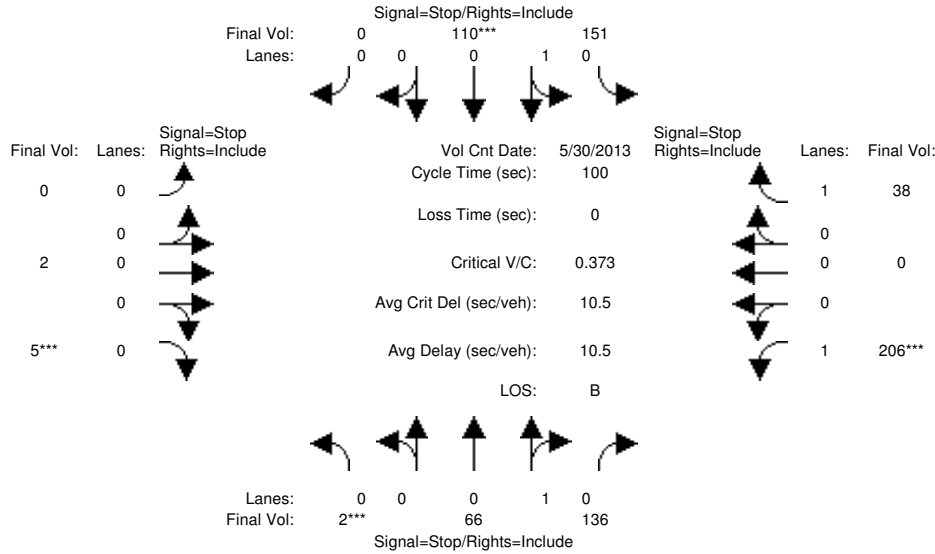

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

 Peak Hour Volume Signal Warrant Report [Urban]

 Intersection #19 California St / Del Medio Ave

Future Volume Alternative: Peak Hour Warrant NOT Met

Approach:	North Bound			South Bound			East Bound			West Bound					
Movement:	L	T	R	L	T	R	L	T	R	L	T	R			
Control:	Stop Sign			Stop Sign			Stop Sign			Stop Sign					
Lanes:	0	0	1	0	0	0	0	0	1	0	1	0	0	0	1
Initial Vol:	2	66	136	151	110	0	0	2	5	206	0	38			
Major Street Volume:	466														
Minor Approach Volume:	244														
Minor Approach Volume Threshold:	533														

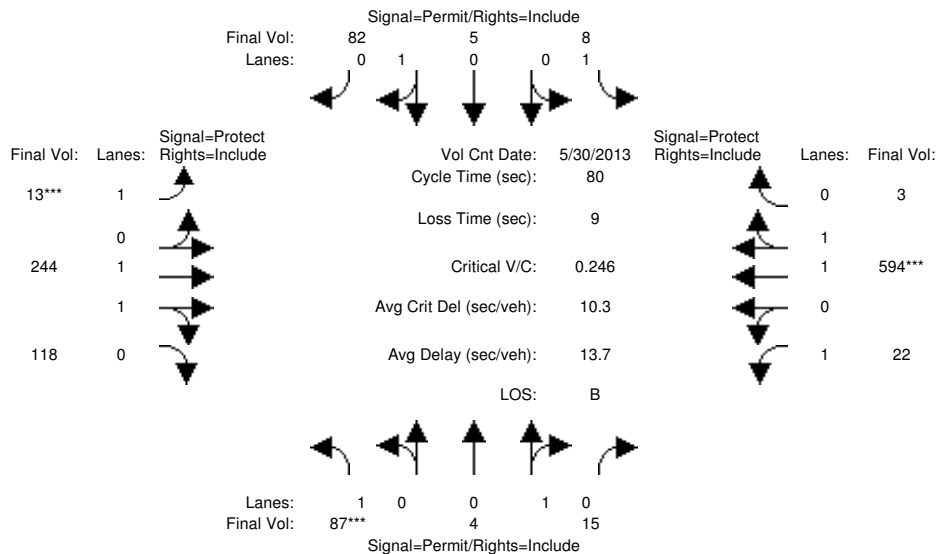

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Lanes:	0 0 1 1 0	1 0 2 0 0	0 0 0 0 0	0 0 1! 0 0
Initial Vol:	0 288 32	52 206 0	0 0 0 0	32 0 86
ApproachDel:	xxxxxx	xxxxxx	xxxxxx	11.1

Approach[westbound][lanes=1][control=Stop Sign]
Signal Warrant Rule #1: [vehicle-hours=0.4]
FAIL - Vehicle-hours less than 4 for one lane approach.
Signal Warrant Rule #2: [approach volume=118]
SUCCEED - Approach volume greater than or equal to 100 for one lane approach.
Signal Warrant Rule #3: [approach count=3][total volume=697]
SUCCEED - Total volume greater than or equal to 650 for intersection with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Table for Critical Gap Module showing Critical Gp and FollowUpTim values for different movements.

Table for Capacity Module showing Cnflct Vol, Potent Cap., Move Cap., and Volume/Cap. ratios for each approach and movement.

Table for Level Of Service Module showing 2Way95thQ, Control Del, LOS by Move, Shared Cap., SharedQueue, Shrd ConDel, Shared LOS, ApproachDel, and ApproachLOS for each approach and movement.

Note: Queue reported is the number of cars per lane.

Peak Hour Delay Signal Warrant Report

Intersection #24 Latham Street / Showers Drive

Future Volume Alternative: Peak Hour Warrant NOT Met

Approach:	North Bound	South Bound	East Bound	West Bound
Movement:	L - T - R	L - T - R	L - T - R	L - T - R
Control:	Uncontrolled	Uncontrolled	Stop Sign	Stop Sign
Lanes:	0 0 1 1 0	1 0 2 0 0	0 0 0 0 0	0 0 1! 0 0
Initial Vol:	0 288 32	52 210 0	0 0 0 0	32 0 86
ApproachDel:	xxxxxx	xxxxxx	xxxxxx	11.1

Approach[westbound][lanes=1][control=Stop Sign]
Signal Warrant Rule #1: [vehicle-hours=0.4]
FAIL - Vehicle-hours less than 4 for one lane approach.
Signal Warrant Rule #2: [approach volume=118]
SUCCEED - Approach volume greater than or equal to 100 for one lane approach.
Signal Warrant Rule #3: [approach count=3][total volume=701]
SUCCEED - Total volume greater than or equal to 650 for intersection with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Peak Hour Volume Signal Warrant Report [Urban]

Intersection #24 Latham Street / Showers Drive

Future Volume Alternative: Peak Hour Warrant NOT Met

Approach:	North Bound	South Bound	East Bound	West Bound
Movement:	L - T - R	L - T - R	L - T - R	L - T - R
Control:	Uncontrolled	Uncontrolled	Stop Sign	Stop Sign
Lanes:	0 0 1 1 0	1 0 2 0 0	0 0 0 0 0	0 0 1! 0 0
Initial Vol:	0 288 32	52 210 0	0 0 0 0	32 0 86

Major Street Volume: 583
Minor Approach Volume: 118
Minor Approach Volume Threshold: 471

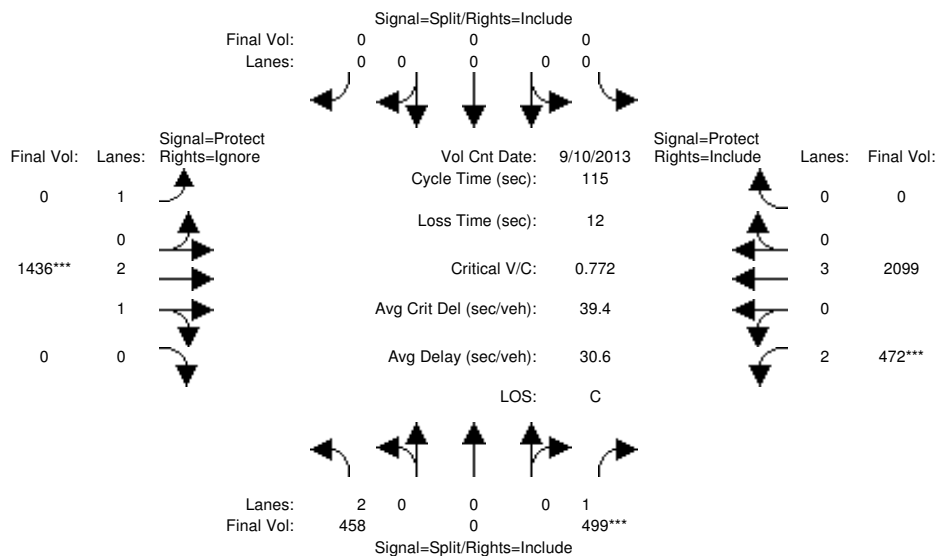

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Minor Approach Volume Threshold:											579									

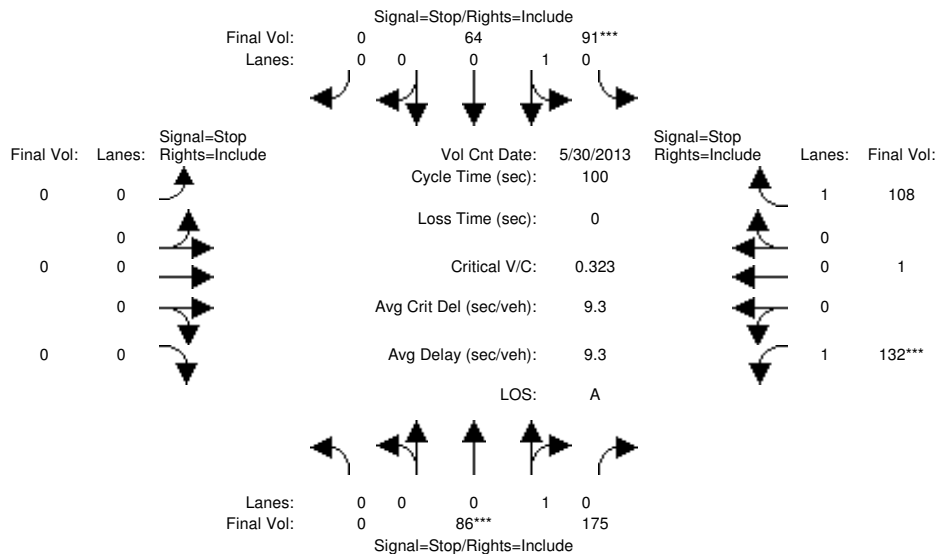

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Minor Approach Volume Threshold:											568									

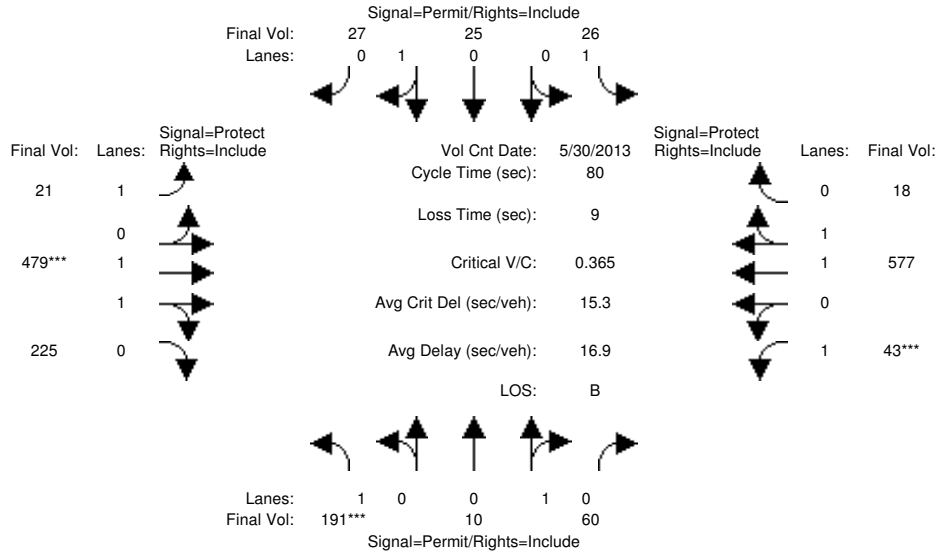

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Approach[westbound][lanes=1][control=Stop Sign]
Signal Warrant Rule #1: [vehicle-hours=0.4]
FAIL - Vehicle-hours less than 4 for one lane approach.
Signal Warrant Rule #2: [approach volume=117]
SUCCEED - Approach volume greater than or equal to 100 for one lane approach.
Signal Warrant Rule #3: [approach count=3][total volume=1017]
SUCCEED - Total volume greater than or equal to 650 for intersection with less than four approaches.

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Sources and Notes:

- "400 Main Street Mixed Use Commercial Project Traffic Impact Analysis", prepared by AECOM, December 2010
- Trips derived from "Los Altos Safeway Expansion Transportation Impact Analysis" prepared by Fehr & Peers, October 2011
- "Bed & Breakfast-Motel Traffic and Transportation Engineering Analysis", prepared by Pang Engineers, Inc., May 2010
- "Los Altos Community Center Master Plan Traffic Study", prepared by AECOM, October 2009
- While the Community Center and City Hall were expanded, the Los Altos Community Center Master Plan TIA used the existing sizes of these facilities for trip generation
- "Los Altos Safeway Expansion Transportation Impact Analysis", prepared by Fehr & Peers, October 2011
- For the time being, this expansion project has resulted in the closure of the existing Safeway. Therefore, the trip generation calculations for this project use the total floor space of the "new" Safeway from the TIA, not just the space added by the expansion ("Los Altos Safeway Expansion Transportation Impact Analysis")
- The Los Altos Safeway Expansion TIA developed project-specific trip generation rates based on both observed counts and the 8th Edition of the ITE Trip Generation Handbook
- Type of residential unit not specified. Assumed apartments
- No trip generation estimates available. Used equations from ITE Trip Generation Handbook, 9th Edition
- "111 N. Rengstorff Avenue Traffic Impact Analysis", prepared by Hexagon Transportation Consultants, Inc., March 2012
- This project will demolish 50 of 188 existing units and construct 133 new units, resulting in a net addition of 83 units.
- No daily rate specified in TIA. Used daily rate from ITE Trip Generation Handbook, 9th Edition
- "2650 El Camino Real (SR 82) Traffic Impact Analysis", prepared by Hexagon Transportation Consultants, Inc., March 2012
- "Precise Plan Amendments and San Antonio Center Project Environmental Impact Report", prepared by LSA Associates, Inc., December 2010
- Trip generation based on unoccupied space/units. As of June 2013, 44% of retail space and 68% of residential units were unoccupied.
- "1255 Pear Avenue - Office Development Traffic Impact Analysis", prepared by Hexagon Transportation Consultants, Inc., May 2013
- To be conservative, the 1255 Pear Avenue TIA used this land use code for trip generation
- These In/Out percentages were developed specifically for the 1255 Pear Avenue TIA
- "100 Mayfield Draft EIR", prepared by Impact Sciences, Inc., December 2005

1 INTRODUCTION

Erler and Kalinowski, Inc. (“EKI”) is pleased to present this water supply assessment study (“WSA Study”) for the proposed Phase II of the Village at San Antonio Center. Phase II of the Village at San Antonio Center is a proposed mixed-use development (“Project”) located on approximately 9.9 acres at the southeast corner of San Antonio Road and California Street in the City of Mountain View, California (“Subject Property”; see Figure 1). The Project includes replacing the existing commercial development with a new, mixed-use development.

Water service for the Subject Property is provided by the City of Mountain View (also referred to as the “City”, herein).

This WSA Study has been prepared by EKI on behalf of Merlone Geier Management, LLC and outlines the requirements of a WSA pursuant to California Senate Bill 610 and summarizes associated information for the Project. The purpose of a WSA is to determine if there is sufficient water to meet the current and planned water demand within the water supplier’s service area for the next twenty years, including the demand associated with the proposed Project, during normal and dry water years.

This WSA Study has been prepared for the sole use and benefit of Merlone Geier Management, LLC. Unless specifically authorized in writing in an agreement acceptable to EKI, reliance on this WSA Study by any other entity or third party is not permitted or authorized. It is our understanding, however, that this WSA Study will be provided to the City of Mountain View for its review and that the City may incorporate information provided herein as part of its independent WSA evaluation for the Project to the degree that the City feels that it is appropriate to do so.

Included in this WSA Study is information related to water supply and demand for the City of Mountain View and the Project. The information contained in this WSA Study is based primarily on the requirements of the California Water Code, “Water Code” §10910-10915, the City of Mountain View’s 2010 Urban Water Management Plan (“UWMP”), and information specific to the Project (i.e., building size and area of landscaping). More specifically, this WSA Study includes:

- A summary of the requirements of Senate Bill 610 (as defined in Water Code §10910-10915) and a description of how they apply to the Project;
- A description and analysis of the current and projected future water demand of the Project through the year 2035;
- A description and analysis of the historical, current, and projected future water demand for the City of Mountain View through the year 2035;
- A description and analysis of the current and projected future water supply for the City of Mountain View through the year 2035; and
- A comparison of the water supply and demand for the City of Mountain View’s water service area, including the projected water demand associated with the Project.

The information provided in this WSA Study is consistent with the information requested within the California Department of Water Resource's ("DWR's") *Guidebook for Implementation of Senate Bill 610 and Senate Bill 221 of 2001: To Assist Water Suppliers, Cities, and Counties in Integrating Water and Land Use Planning*, dated 8 October 2003. The text of specific sub-sections of the Water Code has been included in indented and italicized font at the beginning of specific sections of this WSA Study. The information presented in that section of the WSA Study and associated tables provide information related to that sub-section of the Water Code.

The information and methodology provided in this WSA Study is also consistent with the *Draft Guidance: Preparation of a Water Supply Assessment*, updated September 2013 that has been developed by the City and consistent with the direction provided by the City.

2 GENERAL REQUIREMENTS FOR THE PREPARATION OF A WATER SUPPLY ASSESSMENT

The purpose of this section is to outline what types of projects require WSAs, who is responsible for their preparation, and the necessary components of a WSA.

2.1 APPLICABILITY OF SENATE BILL 610 TO THE PROJECT

Water Code Section 10910

- (a) *Any city or county that determines that a project, as defined in Section 10912, is subject to the California Environmental Quality Act (Division 13 (commencing with Section 21000) of the Public Resources Code) under Section 21080 of the Public Resources Code shall comply with this part.*

Water Code Section 10912

For the purposes of this part, the following terms have the following meanings:

- (a) *"Project" means any of the following:*
- (1) A proposed residential development of more than 500 dwelling units.*
 - (2) A proposed shopping center or business establishment employing more than 1,000 persons or having more than 500,000 square feet of floor space.*
 - (3) A proposed commercial office building employing more than 1,000 persons or having more than 250,000 square feet of floor space.*
 - (4) A proposed hotel or motel, or both, having more than 500 rooms.*
 - (5) A proposed industrial, manufacturing, or processing plant, or industrial park planned to house more than 1,000 persons, occupying more than 40 acres of land, or having more than 650,000 square feet of floor area.*
 - (6) A mixed-use project that includes one or more of the projects specified in this subdivision.*
 - (7) A project that would demand an amount of water equivalent to, or greater than, the amount of water required by a 500 dwelling unit project.*

The City of Mountain View has determined that the proposed Project is subject to the California Environmental Quality Act ("CEQA"). The proposed Project is a mixed-use project that contains, among other elements, a proposed commercial office building(s) with more than 250,000 square feet of office space. Thus, in accordance with Water Code §10910(a) and 10912(a)(3), the proposed Project is defined as a "Project" under the Water Code and a WSA is required.

2.2 RESPONSIBILITY FOR PREPARATION OF THE WSA

Water Code Section 10910

- (b) *The city or county, at the time that it determines whether an environmental impact report, a negative declaration, or a mitigated negative declaration is required for any project subject to the California Environmental Quality Act pursuant to Section 21080.1 of the Public Resources Code, shall identify any water system that is, or may become as a result of supplying water to the project identified pursuant to this subdivision, a public water system, as defined in Section 10912, that may supply water for the project. If the city or county is not able to identify any public water system that may supply water for the project, the city or county shall prepare the water*

assessment required by this part after consulting with any entity serving domestic water supplies whose service area includes the project site, the local agency formation commission, and any public water system adjacent to the project site.

Water for the Project will be supplied by the City of Mountain View municipal water system and therefore, in accordance with Water Code §10910(b), the City is the entity responsible for the WSA for the Project. However, according to the DWR, the Project proponent's consultant or the developer can prepare and submit material to the water supplier to be used in the WSA for the Project. The water supplier is, however, ultimately responsible for the WSA and must exercise its independent judgment as it considers whether or not to adopt the WSA.¹

2.3 COMPONENTS OF A WATER SUPPLY ASSESSMENT

Water Code Section 10910

(c) (4) If the city or county is required to comply with this part pursuant to subdivision (b), the water supply assessment for the project shall include a discussion with regard to whether the total projected water supplies, determined to be available by the city or county for the project during normal, single dry, and multiple dry water years during a 20-year projection, will meet the projected water demand associated with the proposed project, in addition to existing and planned future uses, including agricultural and manufacturing uses.

As listed above in Water Code §10910(c)(4), the primary purpose of a WSA is to evaluate that sufficient water supply is available to meet all future demands within the water supplier's service area, including that associated with the Project, during normal and dry hydrologic years for a 20-year time horizon. In order to complete this assessment, the following information must be included in the WSA:

- The projected water demand associated with the Project at project completion,
- The total water demand projected for the City of Mountain View's service area over the next 20 years, and
- The total projected water supply available to the City of Mountain View over the next 20 years.

Water demand includes both "water use", which is the actual quantity of water that is used by a customer, and "unaccounted for water", which represents water that is lost from the system during distribution. The sum of these two components is referred to herein as "water demand."

¹ From DWR website: <http://www.owue.water.ca.gov/faq/faq.cfm>

Question: Can a consultant/developer prepare the water supply assessment?

Answer: A consultant/developer can prepare and submit material to be used in the water supply assessment, but the water supplier is ultimately responsible for the water supply assessment and must exercise its independent judgment as it considers adoption of the water supply assessment.

3 PROJECT DESCRIPTION

This Project is an infill project that includes the redevelopment of existing uses on an approximately 9.9-acre site that is currently occupied by approximately 59,655 square feet of commercial and retail buildings with associated surface parking and limited landscaping (Figure 1). The Project would include the demolition of the existing commercial and retail buildings and surface parking lots, as well as removal of trees and vegetation that would be replaced in accordance with the Project's landscape plan. As shown in Figure 2, the Project would include the development of six blocks with office, commercial, hotel, retail, cinema, and restaurant uses and irrigated landscaping. The Project would also include one aboveground garage, one below ground garage, and surface parking. The total area of development would be approximately 1,200,000 square feet, broken down into the following land uses:

- (a) 392,853 square feet of office space;
- (b) 82,688 square feet of commercial and retail space;
- (c) 35,358 square feet of restaurant space;
- (d) 67,280 square feet of cinema space;
- (e) a 167-room hotel (142,084 square feet);
- (f) 25,375 square feet of irrigated landscaping, inclusive of a water feature; and
- (g) parking (a total of 2,559 spaces), hardscape, new utilities and other site improvements.

The Subject Property has a 2030 General Plan land use designation as a Mixed-Use Center.

This Project includes and re-envisions a portion of the Phase I of the Village at San Antonio Center. EKI completed a WSA on behalf of Merlone Geier Management, LLC for Phase I of the Village at San Antonio Center ("Phase I WSA"). As such, the Phase I WSA that the City adopted in 2010 included water demands for an area (i.e., the Northern Retail Area) that is superseded by the currently proposed Project. This WSA Study will present the total water demand for the Project, as well as the net new (incremental) demand after accounting for the portion of the total demand that was already approved as part of the Phase I WSA.

4 PROJECT WATER DEMAND

The Subject Property currently includes 59,655 square feet of commercial and retail buildings and 683 spaces of surface parking. The existing retail businesses include Ross Dress for Less, BevMo!, Fantastic Hair & Nail Salon, and Kumon Math & Reading Center, and formerly included Barron Park Supply Company and the International Market. These businesses employ a total of approximately 43 employees per day. There are a total of 76 existing trees, including eight Heritage Trees. Existing water use at the Subject Property is associated with typical commercial and retail-type activities (e.g., restrooms and limited landscape irrigation).

Future water demand associated with the Project will continue to be used for commercial and retail activities, although with some water use intensification associated with the conversion to restaurant, hotel and cinema land uses. The Project will also result in an increase in floor area from 59,655 square feet to 720,263 square feet, which will result in a net incremental increase of water demand at the Subject Property.

The City of Mountain View requires new non-residential development projects greater than 25,000 square feet to meet the intent of LEED Gold and comply with the mandatory CalGreen Requirements². As such, the Project will include a number of energy-efficiency and other sustainability features, and specifically will include the following water conserving elements:

- Use of low-flow lavatory faucets, toilets and urinals in accordance with the LEED Gold standard and CalGreen Requirements;
- Inclusion of low-water use landscaping to minimize outdoor water use; and
- Potential use of grey water for irrigation.

4.1 CURRENT AND HISTORICAL WATER USE AT THE SUBJECT PROPERTY

Water use at the Subject Property is metered and recorded by the City of Mountain View on a monthly basis. Water use data for the period from January 2003 through August 2013 for the six commercial water accounts currently occupying the Subject Property were received from the City of Mountain View on 21 October 2013. A summary of the total historical water use for the Subject Property is included in Table 1. Average annual water use for the Subject Property from 2003 through 2012 was approximately 4.7 acre-feet per year (“AFY”), with annual water use ranging from 3.11 AFY in 2012 to 6.06 AFY in 2004.

4.2 FUTURE WATER USE ASSOCIATED WITH THE PROJECT

Water use by commercial water customers can consist of a wide variety of end uses, such as restrooms, kitchens, water fountains, and irrigation. Currently, no standard water use models

² As described on the City’s website:
http://www.ci.mtnview.ca.us/city_hall/community_development/buildings/mountain_view_green_building_code.asp

allow development of project-specific commercial water use factors. However, general water use factors are available for various types of commercial accounts based on the square footage of commercial floor space and landscaping area. For this WSA Study, future water demand for the Project is estimated using the following two methodologies:

- (1) ***Gallons per Employee per Day Method***: Water use is estimated based upon the per-employee water use factors and conservation assumptions from the Pacific Institute, 2003.³
- (2) ***Mountain View Unit Water Duty Factors***: Water use is estimated based upon unit water duty factors from the City's 2010 Water Master Plan, as applied under the direction of City staff in 2013.

A description of each of the employed methodologies is included below. A summary of the resulting water use projections are provided in Table 2.

4.2.1 Gallons per Employee per Day (“GED”) Method

The Pacific Institute's *Waste Not Want Not: The Potential for Urban Water Conservation in California* (2003) is the primary reference used to estimate Project water demand based upon the building employee occupancy. This information is augmented by information regarding the number of employees per square foot from the Energy Information Administration (“EIA”), 2006.⁴ Based upon the Pacific Institute and EIA studies, commercial water use factors were developed for office, retail, cinema, and restaurant land uses. The estimated Project water demand includes information and assumptions regarding:

- The average water use per employee per workday,
- The typical number of employees per floor area,
- The typical number of workdays per year,
- Estimated irrigation demands, and
- Additional conservation saving measures not incorporated into employee water use factors for existing buildings.

The estimated water demand calculations utilizing the GED Method are shown in Table 3. The estimated water demand for the Project based upon the GED Method is 62 AFY. Relative to the historical water demand for the Subject Property, and after accounting for the volume of water that was approved as part of the Phase I WSA, the Project will result in an incremental water demand of 37 AFY. When estimating future Project water demand for new buildings, the GED

³ Pacific Institute, 2003. *Waste Not, Want Not: The Potential for Urban Water Conservation in California*, November 2003.

⁴ 2003 Commercial Buildings Energy Consumption Survey: Building Characteristics Tables Revised (Energy Information Administration, 2006).

Method water savings associated with improved water use efficiency were incorporated into the estimate, commensurate with the water-efficient design of the new development.

For comparison purposes, the GED Method was also used to estimate the water use for the existing facilities on the Subject Property. When the GED Method was utilized to estimate the historical water use for the existing facilities, potential water conserving features were not included in the estimate. For the existing facilities, the GED Method estimates the water use to be 5.0 AFY, which is very close to the average annual water use for the Subject Property based upon historical records.

While the GED Method provides reasonable estimates for historical water use at the Subject Property when compared to actual, measured water use data, it likely provides a conservative estimate of future water demand for the Project. This is because the GED Method assumes that a substantial fraction of the total future water demand for the Project (i.e., approximately 20 AFY out of the total of 62 AFY) will be for landscape irrigation, when in reality, the limited landscape area of the proposed Project is likely to require very little water.

4.2.2 City of Mountain View Water Master Plan Unit Demand Factors

The City of Mountain View's Water Master Plan (Mountain View, 2010), its General Plan Update Utility Impact Study (Mountain View, 2011a), and its Draft Water Supply Assessment Guidance (Mountain View, 2013) describe standard unit water demand factors ("water unit duty factors") for estimating water use for specific land uses. It should be noted that water use factors developed for water system master plans do not typically consider the details of individual, parcel-level development plans and are typically intentionally conservative to ensure adequate sizing of water system infrastructure (e.g. to meet fire flow and peaking demands).

The estimated water demand for the Project utilizing the City of Mountain View's water unit duty factors is shown in Table 4. Use of Mountain View water unit duty factors results in a total estimated water demand of 147 AFY for the Project. Relative to the historical water use for the Subject Property, and after accounting for the volume of water that was approved as part of the Phase I WSA, the Project will result in an incremental water demand of 122 AFY.

For comparison purposes, the Mountain View water unit duty factors were also used to estimate the water use for the existing facilities on the Subject Property. For the existing facilities, the City's water unit duty factors estimate the water use to be 8.7 AFY, which is approximately 85 percent greater than the average water use on the Subject Property based upon historical records and 43 percent greater than the historical maximum water use for the Subject Property. This comparison of actual versus estimated historical water use using the Mountain View water unit duty factors suggests that the Mountain View water unit duty factor method is conservative.

4.2.3 Comparison of Methodologies used to Estimate Project Water Use

Based on the two methodologies described above, and as shown in Table 2, the future water demand associated with the Project is projected to be between 62 AFY and 147 AFY, with an incremental water demand of approximately 37 AFY to 122 AFY when compared to the estimate

of historical water use for the existing Subject Property, and after accounting for the volume of water that was approved as part of the Phase I WSA. The difference in the results obtained by the two methodologies is due to differing assumptions regarding the water use factors.

In EKI's opinion, the Mountain View unit water duty method likely overestimates the incremental Project water demand, especially given the planned water-efficient design of the new development; however, it has been retained in this WSA Study to provide an upper bound for the range of potential water demands of the Project.

5 CITY OF MOUNTAIN VIEW WATER DEMAND

Water Code Section 10910

- (c) (1) *The city or county, at the time it makes the determination required under Section 21080.1 of the Public Resources Code, shall request each public water system identified pursuant to subdivision (b) to determine whether the projected water demand associated with a proposed project was included as part of the most recently adopted urban water management plan adopted pursuant to Part 2.6 (commencing with Section 10610).*
- (c) (2) *If the projected water demand associated with the proposed project was accounted for in the most recently adopted urban water management plan, the public water system may incorporate the requested information from the urban water management plan in preparing the elements of the assessment required to comply with subdivisions (d), (e), (f), and (g).*
- (c) (3) *If the projected water demand associated with the proposed project was not accounted for in the most recently adopted urban water management plan, or the public water system has no urban water management plan, the water supply assessment for the project shall include a discussion with regard to whether the public water system's total projected water supplies available during normal, single dry, and multiple dry water years during a 20-year projection will meet the projected water demand associated with the proposed project, in addition to the public water system's existing and planned future uses, including agricultural and manufacturing uses.*

The most recent City of Mountain View UWMP is from 2010. In its 2010 UWMP, the City of Mountain View reports the current and projected future water demand for its water system service area. In accordance with the UWMP Act (Water Code §10610-10656), the City's projected future water demand is presented in five year increments, between the years 2010 and 2035, and is subdivided between the following six customer sectors: (1) residential single family, (2) residential multi-family, (3) commercial and institutional, (4) industrial, (5) landscape, and (6) other.⁵

Pursuant to Water Code §10910(c)(2), the information contained within the City of Mountain View's 2010 UWMP can be used herein to address the WSA requirements if the water demand associated with the Project was accounted for in the most recent UWMP. Because the estimated increase in water demand attributed to the Project (i.e., between approximately 37 and 122 AFY; Table 2) is less than the estimated City-wide increase in total demand by 2035 of approximately 3,320 AFY (see Table 6), the water demand associated with the Project could potentially be considered to be within the projected increase in city-wide demand accounted for in the 2010 UWMP. However, to be conservative, and in accordance with guidance provided by City staff⁶, we have considered the demand attributed to the Project to be additive to the total water demands included in the 2010 UWMP and have conducted our analysis accordingly.

⁵ System water loss is also included in the future water demand listed in the UWMP (Mountain View, 2010). Losses were assumed to be approximately 7.5 percent of the total system water use.

⁶ Verbal direction provided by City of Mountain View staff on October 16, 2013.

5.1 POPULATION AND EMPLOYMENT PROJECTIONS

Future water demands for the City of Mountain View's service area were projected by the City in coordination with the San Francisco Public Utilities Commission ("SFPUC"). As part of the SFPUC's Water System Improvement Program ("WSIP"), a Demand Management Decision Support System Model ("DSS Model") was developed for each of the SFPUC's wholesale customers to project future water demand utilizing population and employment projections within each customer's service area. Mountain View's DSS Model was most recently revised as part of its 2010 UWMP to account for several changes, including recycled water use in the North Bayshore Area and updated population and employment projections based on the Council-endorsed strategy for the 2030 General Plan.

Future population within the City of Mountain Views water service area was projected within the 2010 UWMP based on the City's 2030 General Plan Strategy, which was endorsed by the City Council in December 2010. Under this alternative, the 2030 General Plan may support as many as 86,732 residents within the City's existing service area in 2030. Extension of this growth trend through 2035 results in a projected population of 90,057.

The City also supplies water to several CII customers, which were collectively estimated to provide 62,073 jobs within the City's water service area in 2010. Based on the 2030 General Plan Strategy, job growth is anticipated to grow to 81,803 in 2030. Extension of this growth trend to 2035 results in an estimated 86,735 jobs in 2035. According to the 2010 UWMP and City of Mountain View representatives, the projected future CII water uses within the City have not been allocated to specific development projects, but rather reflect water use increases associated with general commercial growth within the City's service area.⁷

5.2 TOTAL WATER DEMAND

As described above, total water demand for the City of Mountain View is the sum of the measured water use within the City ("water use"), and water that is lost during distribution ("system loss" or "unaccounted for water"). Water use within the City of Mountain View is measured using water meters that are installed at each customer account. Records of current and historical water use at each account are maintained by the City Public Works Department. These data are then submitted to the Bay Area Water Supply and Conservation Agency ("BAWSCA") and the DWR for inclusion in their annual reports.

The current and historical measured water demand and the projected future water demand within the City of Mountain View's service area is reported in the 2010 UWMP, and is summarized below. A summary of measured water use between 2005 and 2012 is provided in Table 5 and

⁷ It is understood that employment numbers based on projections in the City's 2030 General Plan will likely be exceeded due to changes in projected land uses in the San Antonio Change Area, to be described in the forthcoming General Plan Subsequent EIR. However, since this WSA Study considers the Project water demands to be additive onto (i.e., not included in) the projected City-wide demand based on the 2010 UWMP, this study is conservative with respect to the estimated actual total future demand.

the projected water demand between 2010 and 2035, from the 2010 UWMP, is provided in Table 6 in five year increments.

According to information provided to EKI by City of Mountain View staff on 26 November 2013, total water use for the City of Mountain View was approximately 11,238 AFY in 2012. As shown in Table 5, historical water use between 2005 and 2012 actually decreased by approximately 585 AFY (5 percent decrease). Likely reasons for the decline in water use within the City between 2005 and 2012 include a multiple-year drought and an economic downturn resulting in lower residential and non-residential water use. Therefore, water use in recent years may be artificially depressed and would be expected to recover to some degree in the near future assuming drought and economic conditions improve.

To account for the potentially depressed water demand observed in recent years, EKI utilized the average water demand between 2005 and 2012 for comparison to future demand projections, rather than relying solely on the most recent 2012 water demands. Specifically, a baseline water demand was estimated using the average total water use between 2005 and 2012 plus an estimate of unaccounted for water (i.e., approximately 7.5 percent of total water use), which resulted in a baseline City-wide water demand estimate of 12,546 AFY (Table 6). Based on the DSS Model results and an estimated system loss of 7.5 percent, the City projected a growth in total water demand of approximately 3,320 AFY by 2035 relative to the baseline, including 3,087 AFY of projected growth in total water use and 233 AFY of projected growth in unaccounted for water (see Table 6).

5.3 OTHER PLANNED PROJECTS WITHIN THE CITY'S WATER SERVICE AREA

Table 7 identifies other approved and anticipated projects within the City of Mountain View's water service area that constitute a portion of the additional 3,320 AFY of total City-wide water demand projected by 2035 in the 2010 UWMP. These projects were identified on the basis of information provided by the City's Planning Division⁸. Potential water demands associated with these projects were estimated on the basis of the City's water unit duty factors and are presented in Table 7. As summarized in this table, total estimated water demands associated with all of the known, planned projects is 637 AFY.⁹

Table 8 shows a comparison of the projected increase in City-wide water demand with the incremental water demand associated with the Project and other planned projects. As shown in Table 8, it is estimated that approximately 2,683 AFY of additional water demand (i.e., 3,320 AFY minus 637 AFY) can be accommodated within the City's service area after the water demand for all the currently planned projects is accounted for, when and if build out of those projects occurs. After taking into account the estimated water demand for the Project,

⁸ Projects were identified from the City of Mountain View Community Development Department October 2013 Planning Division Update, dated 4 October 2013.

⁹ These water demand estimates likely overestimate water use associated with these projects because they are not incremental water use estimates and do not account for existing water uses at each property. Further, as described in Section 4, the City's water unit duty factors likely represent conservative water demand estimates.

approximately 2,561 to 2,646 AFY of additional water demand can be accommodated within the City's service area.

6 CITY OF MOUNTAIN VIEW WATER SUPPLY

This section identifies the City’s water supplies and discusses the vulnerability of the various supplies to drought and other factors affecting water reliability.

6.1 IDENTIFICATION OF WATER SUPPLY RIGHTS

Water Code Section 10910

(d) (1) The assessment required by this section shall include an identification of any existing water supply entitlements, water rights, or water service contracts relevant to the identified water supply for the proposed project, and a description of the quantities of water received in prior years by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), under the existing water supply entitlements, water rights, or water service contracts.

Pursuant to Water Code §10910(d)(1), a WSA is required to include identification of all water supply entitlements, water rights, and water service contracts relevant to the identified water supply for the Project. In accordance with these requirements, a summary the City of Mountain View’s water supply sources and the agreements between the City and its wholesale suppliers is provided below and in Tables 9 and 10.

6.1.1 SFPUC Regional Water System

The City of Mountain View receives water from the City and County of San Francisco’s Regional Water System (“Regional System”), operated by the SFPUC. This supply originates predominantly from the Sierra Nevada, delivered through the Hetch-Hetchy aqueducts, but also includes treated water produced by the SFPUC from its local watersheds and facilities in Alameda and San Mateo Counties. Approximately 85 percent of the Regional System supply comes from the Tuolumne River through Hetch-Hetchy Reservoir. The remaining 15 percent comes from local watersheds through the San Antonio, Calaveras, Crystal Springs, Pilarcitos and San Andreas Reservoirs.

The business relationship between San Francisco and its wholesale customers (including Mountain View) is largely defined by the Water Supply Agreement between the City and County of San Francisco and Wholesale Customers in Alameda County, San Mateo County and Santa Clara County (“Agreement”) entered into in July 2009. The Agreement, which has a 25-year term, addresses water supply availability for the Regional System as well as the methodology used by the SFPUC in setting wholesale water rates. This agreement succeeds an earlier 25-year agreement signed in 1984.

The Agreement provides 184 million gallons per day (“MGD”) to the wholesale customers during normal water years. This volume, referred to as the “Supply Assurance” is subject to reduction during periods of water shortage due to drought, emergencies or other scenarios resulting in a water shortage. Each wholesale customer’s share of the 184 MGD is referred to as their Individual Supply Guarantee (“ISG”). Mountain View’s ISG is 13.46 MGD (or

approximately 15,077 AFY). Although the Agreement expires in 2034, the Supply Assurance and ISG continue in perpetuity.

The Agreement also recognizes the SFPUC's decision made in October 2008 to (a) defer any consideration of an increase to the 184 MGD Supply Assurance until 2018, (b) place an interim limit on sales of 184 MGD for all wholesale customers, including San Jose and Santa Clara, (i.e., who do not have ISGs), (c) establish interim supply allocations ("ISAs") for each wholesale customer through 2018, and (d) develop an environmental enhancement surcharge to be applied to wholesale agencies that exceed their ISA, if total use by SFPUC's retail customers and wholesale customers exceeds 265 MGD.

However, these ISAs are entirely distinct from the permanent ISGs as they will last only until 2018 and will solely be used to determine when the surcharge will apply. Therefore, although the establishment of such ISA's may potentially increase the cost of water supplied by SFPUC to the City of Mountain View (i.e., if it exceeds its ISA at a time when collective deliveries from the Regional System exceed 265 MGD) it will not affect its ISG of 13.46 MGD. Therefore, projected water supplies to the City of Mountain View from SFPUC that are identified in the 2010 UWMP and rely on the City's ISG have not been modified based upon the provisions of the new Agreement.

Between 2005 and 2010, the City of Mountain View purchased approximately 87 percent of its potable water supplies from the SFPUC. By 2035, the City projects that it will purchase approximately 12,645 AFY, or 89 percent of its total potable supplies, from the SFPUC in order to meet the projected future water demand of its service area. The City's current and projected purchase quantities are approximately equal to an average of 8.9 and 11.3 MGD per day, respectively, and are both less than the City's ISG of 13.46 MGD.

6.1.2 SCVWD Treated Water

Between 2005 and 2010, approximately 9.5 percent of the City of Mountain View's total water supply was purchased from the Santa Clara Valley Water District ("SCVWD"). According to the 2010 UWMP, Mountain View's treated water supply relationship with the SCVWD is governed by a 70-year water supply contract entered into in 1984. Pursuant to this agreement, the City submits proposed delivery schedules to the SCVWD estimating the volume of treated water needed from the SCVWD in three-year periods. In addition to the estimated three-year delivery schedule, the SCVWD retailers also submit anticipated monthly deliveries for the coming year, as well as information needed in order for the SCVWD to project annual deliveries for the next five years.

The SCVWD manages all of its water supplies in an effort to meet the requested treated water deliveries, while balancing other demands on the system, such as groundwater recharge and banking. The SCVWD serves surface water to its retail customers from the following supply sources:

- Surface water purchased from the United States Bureau of Reclamation ("USBR") Central Valley Project ("CVP"),

- Surface water purchased from the DWR’s State Water Project (“SWP”), and
- Surface water from the local watersheds that is captured in SCVWD’s local reservoirs.

Though raw water is available to some of SCVWD’s customers, the City purchases treated water from SCVWD, which is delivered to the City through SCVWD’s West and Mountain View pipelines.

Based on the planned future water uses within the City’s service area and the planned future water supply, the City has estimated that approximately 1,325 AFY of water, approximately 9.3 percent of its total potable supplies, will be purchased from the SCVWD in 2035. This is equal to an average delivery of approximately 1.18 MGD.

6.1.3 Recycled Water Supply

The City uses recycled water from the Palo Alto Regional Water Quality Control Plant (“RWQCP”) for irrigation of public and private landscapes in the North Bayshore Area. During 2004, the City Council adopted Article V, Chapter 35 of the City Code related to the use of recycled water for irrigation. Pursuant to the City Code, retail, commercial and industrial customers within the North Bayshore Area must use recycled water for landscape irrigation. These requirements apply both to existing users and to future users. Penalties for noncompliance with the ordinance include discontinuance of potable water service and a 50 percent surcharge for the use of potable water.

To assist customers in converting to the recycled water system, the *Mountain View Water Reuse Rules and Regulations* were completed in 2010. This document outlines design and installation specifications, operation and maintenance responsibilities, and the process for connecting to the City’s recycled water system. To further encourage the use of recycled water, customers receive the added benefit of reduced water rates. In 2010, recycled water was available at a 25 percent discount from potable water, and customers were charged a uniform rate instead of the increasing block rate used for the potable water system.

During 2012, the City utilized 550 AFY of recycled water and is projected to use 1,610 AFY of recycled water by 2035, which will offset approximately 800 AFY of potable water demand. The difference between estimated use of recycled water and the amount of potable water offset is based upon an assumption that approximately 25 percent additional use of recycled water will be needed to flush excess salts that may accumulate from the use of recycled water.

6.1.4 Groundwater

Water Code Section 10910

(f) If a water supply for a proposed project includes groundwater, the following additional information shall be included in the water supply assessment:

(1) A review of any information contained in the urban water management plan relevant to the identified water supply for the proposed project.

A water supply assessment shall not be required to include the information required by this paragraph [Sections (f)(2) through (f)(5)] if the public water system determines, as part of the review required by paragraph (1), that the sufficiency of groundwater necessary to meet the initial and projected water demand associated with the project was addressed in the description and analysis required by paragraph (4) of subdivision (b) of Section 10631.

The City¹⁰ operates seven active potable groundwater wells to supplement imported water supplies. The City also owns one, inactive irrigation well at Shoreline Regional Park for supplemental irrigation purposes. When previously in operation, water from the irrigation well did not enter the potable water system but, instead, was used directly for landscape irrigation. Since 2009 this non-potable irrigation supply has been replaced with recycled water from the Palo Alto RWQCP.

Between 2005 and 2012, the City produced an average of approximately 436 AFY of groundwater, approximately 3.5 percent of its total potable supply. Since 1990, Mountain View has produced an average of 599 AFY, with a high of over 1,500 AF in 1991. Most of this groundwater is pumped directly into the potable water distribution system or non-potable irrigation ponds; however, a portion of the water is also used for general operation and maintenance of the groundwater wells. Groundwater production in 2035 is anticipated to meet approximately 2 percent of the City's total potable water needs.

6.1.5 Other Water Supplies

In addition to imported water from the SFPUC and the SCVWD, groundwater produced from the City's groundwater wells, and recycled water from the Palo Alto RWQCP, a small percentage of the City's water supply is obtained from local surface water. This water is used, in conjunction with local groundwater, for irrigation purposes (i.e., for the Shoreline Golf Links).

6.2 TOTAL SUPPLY IN NORMAL, SINGLE DRY, AND MULTIPLE DRY YEARS

In 2012 the City purchased approximately 92 percent of its total water supply from the SFPUC Regional System and the SCVWD's treated water system. The remaining 8 percent of the City's water was obtained from groundwater and recycled water. The City's current and planned future water supply from 2010 through 2035 is listed in Table 10 for normal hydrologic years, along with the estimated maximum supply available from all sources.

During single dry years, the City expects that combined deliveries from SFPUC and SCVWD will be reduced by a range of between 3 percent during 2015 and 14 percent during 2035 relative

¹⁰ The water demand associated with the Project is assumed to be included in, or only add a small increment to, the City's total future water demand projected in the 2010 UWMP. Based upon the information in the 2010 UWMP, the City should be able to meet the projected 2035 water demands (i.e., 15,987 AFY inclusive of the Project) during normal years from its ISG from the SFPUC and SCVWD water supplies (i.e., which total 16,402 AFY). Therefore, for the purpose of this WSA Study, it is assumed that a review and description of the information contained within the 2010 UWMP should be sufficient to meet the requirements of Water Code §10910(f) with respect to the City's groundwater supply.

to deliveries during normal hydrologic years (see Table 11). During multiple dry years, the City expects that combined deliveries from the SFPUC and SCVWD will be reduced by a range of between 14 percent during the fifth year of a drought that begins during 2015 and by 24 percent during the fifth year of a drought that begins during 2035 (see Table 12).

Projected supply shortfalls will be met through the implementation of the City's Water Shortage Contingency Plan. As described in the 2010 UWMP, the City has developed a Water Shortage Contingency Plan that systematically identifies ways in which the City can reduce water demands and augment supplies during dry years. The indoor and outdoor water use reduction goals in the Water Shortage Contingency Plan range from 5 to 15 percent for indoor water use and from 15 to 100 percent for outdoor water use, for an overall demand reduction of greater than 40 percent.

To increase the effectiveness of water shortage response efforts of individual agencies across Santa Clara County, a subcommittee of retailer suppliers developed model "Stages of Action" to serve as a common framework for individual retailers' 2010 UWMPs. The City incorporated the County-wide model into its Water Shortage Contingency Plan, adjusting as necessary, based on the City's water-use patterns and to align with the City's plans and operating capabilities.

As a customer within the City's service area, the Project would be obligated to comply with the demand reduction efforts imposed by the City through implementation of the Water Shortage Contingency Plan. Therefore, Project-specific conservation during dry years would contribute to the Project's proportionate share of the reduction in water demands during dry years.

6.3 ADDITIONAL WATER SUPPLY RELIABILITY FACTORS

Reliability of the City's water supplies may be impacted directly or indirectly in the future by factors in addition to those summarized above and quantified in the 2010 UWMP. These factors include, among other things, (1) recent litigation on the management of endangered species in the Sacramento – San Joaquin Delta and (2) uncertainties related to the SFPUC's Water System Improvement Program ("WSIP") and the impacts to water supply reliability associated with the Federal Energy Regulatory Commission ("FERC") relicensing of New Don Pedro Dam.

7 COMPARISON OF SUPPLY AND DEMAND

As can be seen in Tables 6, 10 and 13, based on the City's 2010 UWMP, during normal years the City is expected to have adequate water supplies to meet its projected demands. If the incremental Project demand (37 to 122 AFY) is added to the projected total City demand, there is still more than sufficient supply to meet the anticipated total demand during normal years through 2035 (see Table 13).

During single-dry years in 2035, the City's total water demand, without the Project, is expected to exceed total supply by approximately 1,972 AFY, which results in a total water supply shortfall of 13.8 percent (Table 11). If the incremental Project demand (37 to 122 AFY) is added to the projected total City demand, the single dry year shortfall in 2035 is projected to be between 2,009 and 2,094 AFY. This represents an overall supply shortfall of between 14.1 and 14.6 percent (see Table 13) and an incremental impact of approximately 0.22 to 0.73 percent to the without-Project conditions in 2035.

During multiple-dry years in 2035, without the Project, the City's water demand is projected to exceed the total supply by approximately 3,412 AFY, which results in a total water supply shortfall of 23.9 percent (Table 12). If the incremental Project demand (37 to 122 AFY) is added to the projected total City demand, the multiple dry year shortfall in 2035 is projected to be between 3,449 and 3,534 AFY. This represents an overall supply shortfall of between 24.1 to 24.6 percent and an incremental impact of approximately 0.20 to 0.64 percent to the without-Project conditions in 2035.

As described in Section 6, in response to anticipated future dry year shortfalls, the City has developed a Water Shortage Contingency Plan that systematically identifies ways in which the City can reduce water demands and augment supplies during dry years. It is expected that, even without the Project, the City would have to rely on implementation of its Water Shortage Contingency Plan during some dry years to reduce demands. Given the small incremental impact of the Project on the shortage projections, it is not expected that the City would have to change its operations or the implementation of its Water Shortage Contingency Plan in response to a drought, even after the Project was completed.

8 CONCLUSIONS

As listed in Water Code §10910(c)(4), the primary purpose of a WSA is to evaluate that sufficient water supply is available to meet all future water demand within the water supplier's service area, including that associated with the Project, during normal and dry hydrologic years for a 20-year time horizon.

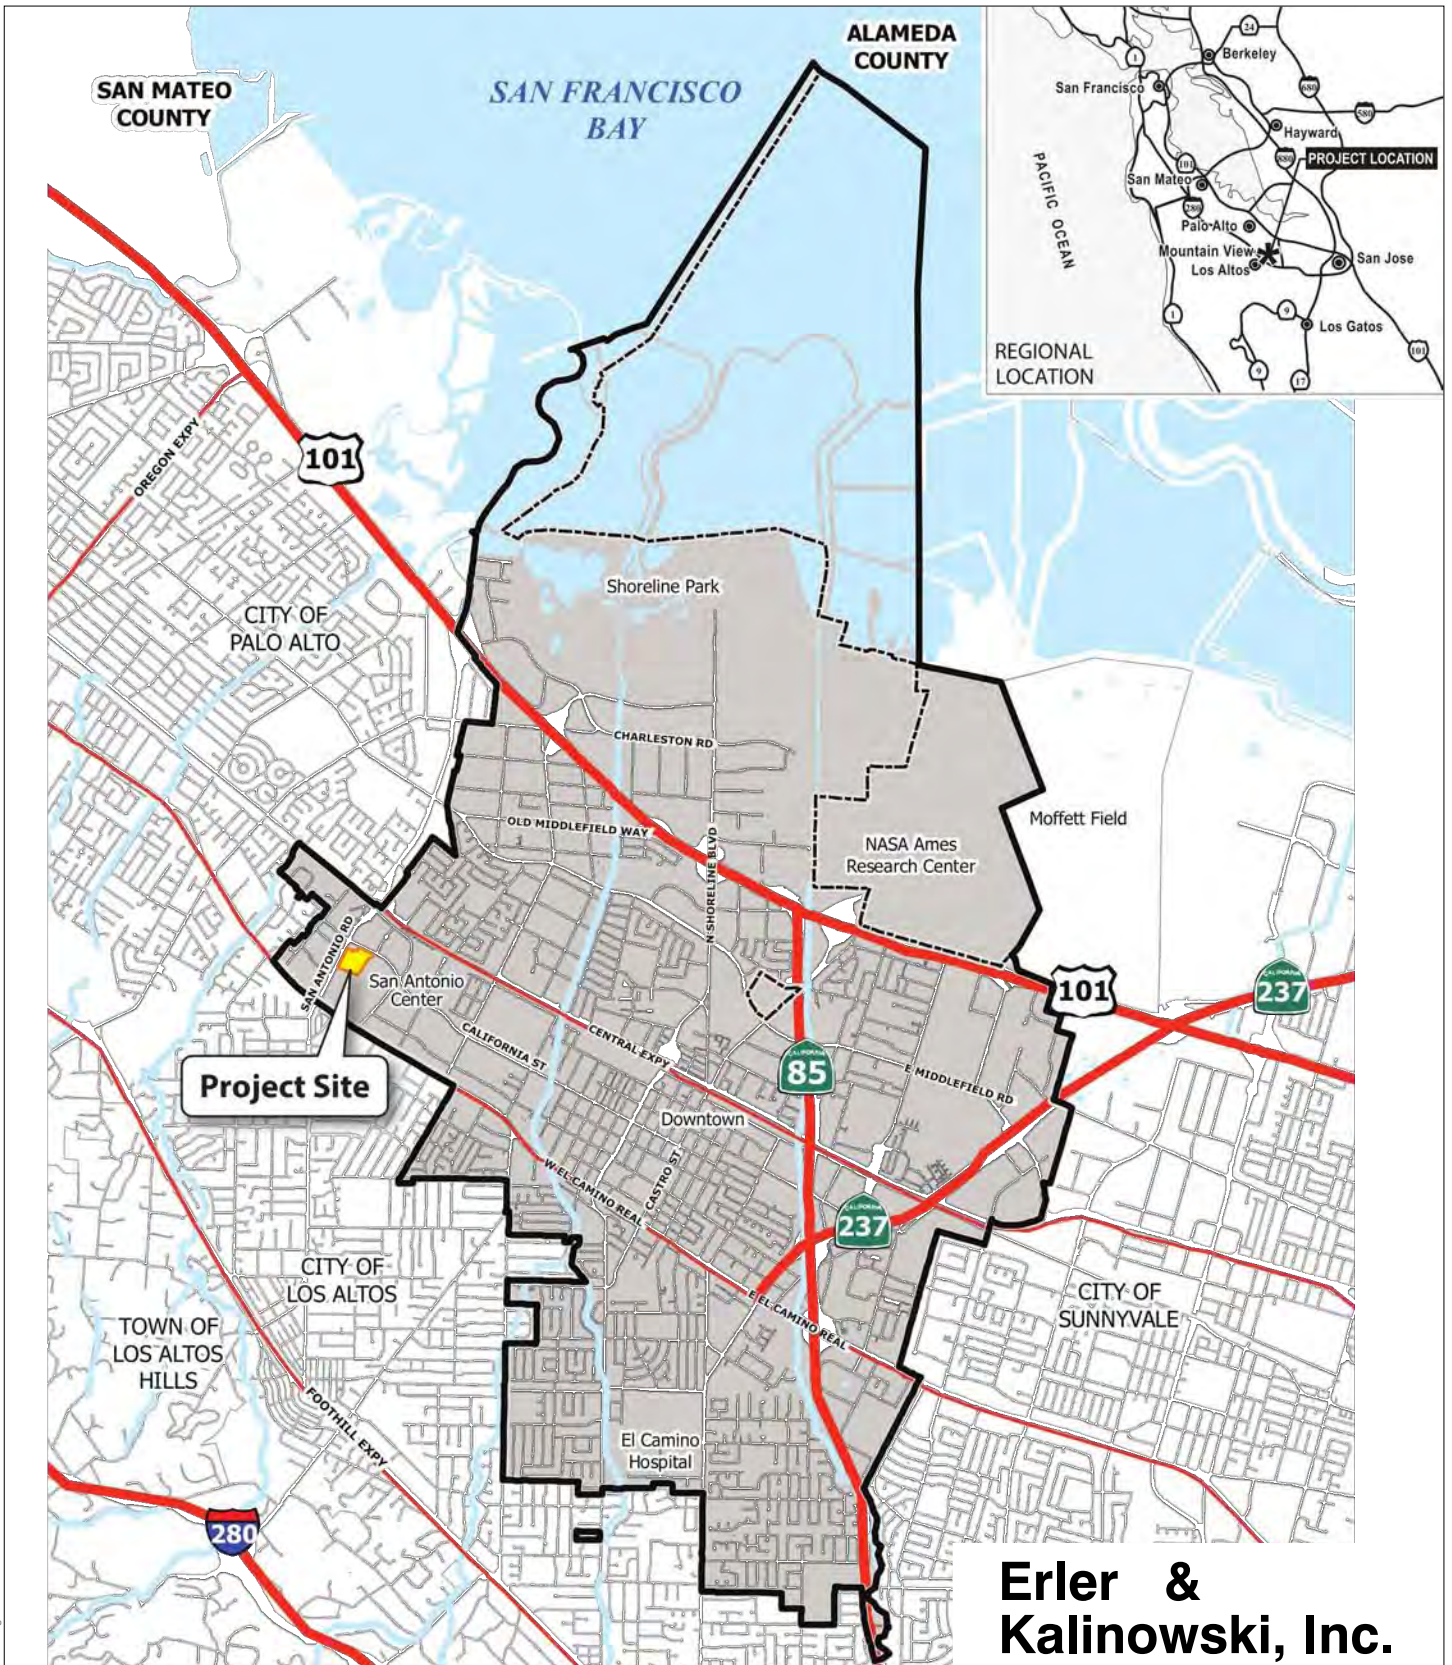

Based on the results of this WSA Study, the City expects to have sufficient water supply to meet its planned demands plus the demands of the Project during normal years through 2035.

During the worst-case drought scenario in 2035 the City projects a water supply shortfall of 23.9 percent, wherein it will implement Stage 2 of its Water Shortage Contingency Plan. Using the City's preferred methodology, build out of the Project is estimated to increase this shortfall by 0.64 percent in 2035, resulting in a total shortage of 24.5 percent. Alternate methodologies result in a lesser increase of 0.20 percent (instead of 0.64 percent) for a City-wide shortage of 24.1 percent.

Therefore, it is concluded that the City of Mountain View has sufficient water supply to meet all future demand within its service area, including that associated with the Project, during normal years for a 20-year time horizon. During dry years the City already expects to experience some supply shortfalls over a 20-year time horizon, and plans to meet these shortfalls through implementation of the first two stages of its Water Shortage Contingency Plan. Build out of the Project is estimated to increase the severity of these shortfalls by between 0.20 to 0.64 percent in the worst-case drought scenario.

Historical Annual Water Consumption
 San Antonio Center Phase II, Mountain View, California

Year	Total Annual Water Use at Subject Property (AFY) (a)
2003	4.81
2004	6.06
2005	5.33
2006	4.22
2007	4.81
2008	5.61
2009	4.66
2010	4.71
2011	3.70
2012	3.11
Average Annual Water Use (2003 - 2012)	4.70

Abbreviations:

"AFY" = acre-feet per year

Notes:

- (a) Total Annual Water Use is based on City of Mountain View monthly metered water use data for properties located at 377, 391, 405, 417, 423, and 455 San Antonio Road, provided to EKI by City of Mountain View staff on 21 October 2013.

Table 2
Summary of Estimated Project Water Demand Using Different Estimation Methods
 San Antonio Center Phase II, Mountain View, California

	[A]	[B]	[C] C = B - A	[D]	[E] E = D - A	[F]	[G] G = D - F
Demand Estimation Method	Actual Annual Demand of Existing Land Uses (AFY) (a)	Estimated Annual Demand of Existing Land Uses (AFY) (b)	Difference Between Actual and Estimated Annual Demand of Existing Land Uses (AFY)	Total Annual Demand for the Proposed Project (AFY) (c)	Incremental Demand of Proposed Project Relative to Existing Water Use (AFY) (d)	Annual Demand of Approved Phase I Project (AFY) (e)	Additional Demand of Proposed Project Beyond Approved Phase I Project (AFY)
Gallons per Employee per Day (f)	4.7	5.0	0.3	62	58	25	37
Mountain View Unit Water Duty Factors (g)	4.7	8.7	4.0	147	143	25	122

Abbreviations:

"AFY" = acre-feet per year

Notes:

- (a) The actual annual demand of existing land uses is based on historical water consumption records (see Table 1).
- (b) The estimated annual demand of existing land uses is calculated using each demand estimation method (see Tables 3 and 4).
- (c) The estimated annual demand for the proposed project is calculated using each demand estimation method (see Tables 3 and 4).
- (d) The incremental water demand relative to existing water use is calculated by subtracting the actual existing water use (Table 1) from the total estimated annual demand for the proposed project.
- (e) The annual demand of the approved San Antonio Center Phase I Project, Northern Retail Parcel is from Reference 1.
- (f) Water demand was calculated based upon the method established in Reference 2. See Table 3 for additional information regarding the estimation of water use using this method.
- (g) Water demand was calculated based upon water use factors obtained from Reference 3. See Table 4 for additional information regarding the estimation of water use using this method.

Abbreviations:

- "AFY" = acre-feet per year
- "emp" = employees
- "gpd" = gallons per day
- "sq ft" = square feet

Table 3
Estimated Annual Project Water Demand Utilizing the Gallons per Employee per Day ("GED") Method
San Antonio Center Phase II, Mountain View, California

Notes:

- (a) Areas of proposed land uses are based on information provided by ICF on 9 October 2013.
- (b) Employee density is based on Table B1 of Reference 1. Cinema is assumed to have the same employee density as Commercial/Retail.
- (c) The number of employees was estimated by multiplying the floor area ratio, expressed in 1,000 square feet, by the employees per 1,000 square feet.
- (d) The Employee Indoor Water Use Factors are based on information contained in Appendix E of Reference 2.
- (e) The total average daily water use is estimated by multiplying the number of employees by the employee water use factor.
- (f) Days per year are assumed to be 365 for commercial / retail, restaurant, cinema and hotel land uses, and 225 for office land use, from Reference 2.
- (g) The employee water use factors reported in Reference 2 represent water use in older buildings; they do not incorporate the benefits of more recent water saving technologies or account for the City of Mountain View General Plan's requirement that developments above 25,000 sq ft adhere to LEED Silver guidelines and CalGreen standards. Therefore, to account for reductions in water use associated with the installation of water-efficient plumbing fixtures, appliances, landscaping, and other recent technologies, conservation savings, based on the high end of conservation savings potential estimated in Appendix E of Reference 2, were applied to each land use.
- (h) Total annual water demand, in AFY, is calculated as the product of daily water demand, the days per year, and 100% minus the conservation potential. This product is then divided by the number of gallons per acre-foot (325,851).

Table 4
Estimated Annual Project Water Demand Utilizing City of Mountain View Water Unit Duty Factors
San Antonio Center Phase II, Mountain View, California

Notes:

- (a) Areas of proposed land uses are based on information provided by ICF on 9 October 2013.
- (b) Water Unit Duty Factors are based on values from Table 3-6 of Reference 1, as summarized in Reference 2. The Unit Duty Factor to be used for the Office land use for this project is 130 gpd/sq ft, based on the General Plan Update Utility Impact Study land use category of C-O (personal communication, City of Mountain View staff, 15 October 2013).
- (c) Days per year are assumed to be 365 for commercial/retail, restaurant, cinema, office, and hotel land uses.
- (d) Total annual water demand, in AFY, is calculated as the product of daily water demand and the days per year, divided by the number of gallons per acre-foot (325,851).
- (e) The City of Mountain View Water Unit Duty Factors encompass both indoor and outdoor uses.

Historical Water Use for the City of Mountain View
San Antonio Center Phase II, Mountain View, California

Abbreviations:

"AFY" = acre-feet per year

"UWMP" = Urban Water Management Plan

"DWR" = California Department of Water Resources

Notes:

- (a) The measured annual water use for years 2005 through 2010 is from the City of Mountain View's 2010 UWMP (Reference 1). The annual water use for years 2011 and 2012 are from DWR 38 forms, provided to EKI by City of Mountain View staff on 26 November 2013.
- (b) The range of water use during recent years is based on the measured water uses from 2005 through 2012.
- (c) Landscape irrigation uses a combination of potable water, blended water and recycled water.
- (d) Other water use includes water used for construction projects.
- (e) "Unaccounted for water" is defined herein as the difference between the City's customers' metered use and the City's metered supply. The total water use shown here does not include unaccounted for water.

Table 6
Projected Future Water Demands for the City of Mountain View
San Antonio Center Phase II, Mountain View, California

Abbreviations:

"AFY" = acre-feet per year

"UWMP" = Urban Water Management Plan

Notes:

- (a) The current estimated baseline water use is the average of the range of water use during recent years presented in Table 5.
- (b) The projected future water demands were estimated in Table 4-5 of the City of Mountain View's 2010 UWMP.
- (c) The City-wide projected increase in water demand from the current baseline to 2035 is calculated by subtracting the current baseline water demand from the City's 2010 UWMP projected annual water demand for 2035.
- (d) Other water use includes water used for construction projects.
- (e) "Unaccounted for water" is defined herein as the difference between the City's customers' metered use and the City's metered supply. Thus, unaccounted for water includes apparent losses such as customer metering inaccuracies, real losses such as distribution main leakage, and authorized unmetered uses such as fire hydrant flow testing. The baseline value for unaccounted for water is calculated as the product of the total baseline water use and the average percentage of unaccounted for water in the projected future water demands in the City's 2010 UWMP (approximately 7.5%).
- (f) The total water demand is the sum of total water use and unaccounted for water. The projected water demands include savings from plumbing code updates, but do not account additional conservation efforts the City of Mountain View may undertake. The Landscape sector does include both potable and recycled demands.

"sq ft" = square feet

Notes:

(a) Projects were identified from the City of Mountain View Community Development Department October 2013 Planning Division Update, dated 4 October 2013.

(b) Water use was estimated for planned projects only where quantitative estimates of the size of the planned projects (e.g., number of housing units or area and type of development) were provided by the City.

(c) Approved projects include projects with statuses of "approved," "awaiting revisions," "permit issued," "plan check," "scheduled," and "under construction."

(d) Preliminary planning water use factors are based upon the City of Mountain View's unit water duty factors from the Draft 2010 Water System Master Plan.

Table 8
Comparison of Incremental Project Water Demand Estimates to City-Wide Demand Projections
 San Antonio Center Phase II, Mountain View, California

Water Demand Estimate (AFY)							
Total Projected Increase in City-wide Water Demand, 2010 - 2035 (a)	3,320						
Water Demand for Other Planned Projects (b)	637						
Remainder of Projected Increase in City-wide Water Demand (c)	2,683						
	Method for Estimating Project Water Demand (AFY) (d)						
	<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: center;">Gallons per Employee per Day Method</th> <th style="text-align: center;">Mountain View Unit Water Duty Factors</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">37</td> <td style="text-align: center;">122</td> </tr> <tr> <td style="text-align: center;">2,646</td> <td style="text-align: center;">2,561</td> </tr> </tbody> </table>	Gallons per Employee per Day Method	Mountain View Unit Water Duty Factors	37	122	2,646	2,561

37	122						
2,646	2,561						
Incremental Project Water Demand Relative to the Approved Phase I Project (e)							
Remainder of Projected Increase in City-wide Water Demand after Project and Other Planned Uses (f)							

Abbreviations:

"AFY" = acre-feet per year
 "UWMP" = Urban Water Management Plan

Notes:

- (a) The total projected increase in city-wide water demand between 2010 and 2035 is 3,087 AFY, based on the baseline water use and projections within the City of Mountain View's 2010 UWMP (Reference 1) (see Table 6).
- (b) The total estimated water demand for currently planned projects is 637 AFY (see Table 7).
- (c) The remainder of projected increase in City-wide water use is calculated by subtracting the water use for other planned projects from the total projected increase in City-wide water use.
- (d) See Tables 3 and 4 for additional detail regarding each water demand estimation method.
- (e) The incremental project water demand relative to the approved Phase I project is the difference between the total water demand for the project using each method and the approved water demand for the Northern Retail Parcel of the approved Phase I project, which this Phase II project supercedes (see Tables 3 and 4).
- (f) The remainder of projected increase in City-wide water demand is calculated by subtracting the incremental project water demand and the water demand for other planned projects from the total projected increase in city-wide water demand.

Historical Water Supply for the City of Mountain View
San Antonio Center Phase II, Mountain View, California

Abbreviations:

"AFY" = acre-feet per year

"DWR" = California Department of Water Resources

"SCVWD" = Santa Clara Valley Water District

"SFPUC" = San Francisco Public Utilities Commission

Notes:

- (a) The annual water supply production values for 2005 through 2010 are from the City of Mountain View's 2010 UWMP (Reference 1). The annual water supply production values for 2011 and 2012 are from DWR 38 forms provided to EKI by City of Mountain View staff on 26 November 2013. The DWR 38 forms do not distinguish between the two wholesale suppliers, SFPUC and SCVWD.
- (b) The City of Mountain View has a SFPUC supply guarantee of 15,077 AFY.

Table 10
Projected Future Normal Year Water Supply and Estimated Maximum Supply for the City of Mountain View

San Antonio Center Phase II, Mountain View, California

Abbreviations:

"AFY" = acre-feet per year

"SCVWD" = Santa Clara Valley Water District

"SFPUC" = San Francisco Public Utilities Commission

"UWMP" = Urban Water Management Plan

Notes:

- (a) The City of Mountain View's 2010 UWMP (Reference 1) reports projected supplies to the extent that they are needed to meet demand. Excess available supplies are not reported.
- (b) The City of Mountain View has a SFPUC supply guarantee of 15,077 AFY.
- (c) The estimated maximum groundwater supply is equivalent to the historical maximum amount of groundwater produced by the City.
- (d) The estimated maximum recycled water supply is based on capacity ownership in the Regional Water Quality Control Plant (Reference 1).
- (e) Total supply is the sum of the potable and recycled water supplies.

**Water and Sewer Hydraulic Capacity Study for
San Antonio Center Phase II Project**

ICF INTERNATIONAL
WATER AND SEWER HYDRAULIC
CAPACITY STUDY FOR SAN ANTONIO CENTER PHASE II PROJECT

Date: February 5, 2014 – **DRAFT**

Subject: WATER AND SEWER HYDRAULIC CAPACITY STUDY FOR SAN ANTONIO CENTER PHASE II PROJECT

Prepared By: Jiajia Huang, E.I.T.
Reviewed By: Scott Humphrey, P.E. (C64206)

EXECUTIVE SUMMARY

ICF International (ICF) has requested Infrastructure Engineering Corporation (IEC) complete an analysis of the San Antonio Center Phase II (SACII) project as it pertains to the utilities of water and sanitary sewer.

IEC completed a General Plan Update Utility Impact Study (GPUUIS) for the City of Mountain View (City) in October 2011 that analyzed the impact that the Updated General Plan will have on the City's utility systems. In addition, the project site is within the San Antonio Change Area of the City, where sewage is discharged to the Los Altos' San Antonio interceptor sewer. The City has an agreement with the City of Los Altos limiting the amount of sewer flow allowable to the Los Altos' San Antonio interceptor sewer. The City has requested that the GPUUIS and the Los Altos 1970 Sewer Agreement be examined as part of this study. The purposes of this study are to analyze the hydraulic capacity of the City's water and sewer systems based upon the proposed ultimate incremental flow increase of the SACII project, and impact of proposed project on the contractual limitation of sewage to the Los Altos' San Antonio interceptor sewer.

Based upon the fire flow requirements, there is no additional impact on the water system beyond the recommended improvements in the GPUUIS.

A summary of the total 2030 average dry weather flow (ADWF) and total 2030 peak wet weather flow (PWWF) of Alma Recorder Area to the Los Altos' San Antonio Interceptor Sewer with and without the SACII project is shown in Table 8. The report analyzed the development flows and assessed the potential impact to the existing and ultimate sanitary sewer mains downstream of the development and assessed the pipes for hydraulic capacity. The comparison of the ultimate peak wet weather flow (PWWF), both including and excluding the project, can be seen in Table 13. Pipes recommended for upsizing are indicated in red font.

Table ES-1 shows that 11 pipes with their existing diameters fail to meet the City's design criteria. Eight pipe segments have been recommended for upsizing in GPUUIS and three additional pipe segments are recommended for upsizing as they will be 100% full capacity according to the design criteria. It also shows the total ultimate (2030) flow in the affected pipes with the SACII project

and the percentage of contribution flow each agency is responsible for. The SACII project will only be accountable for its incremental flow increase, as the existing flow on the parcels has been accounted for in the City's GPUUIS.

The proportionate share of flow in the ultimate facilities is based on Ultimate (2030) ADWF per "industry standard" cost sharing methodologies. ADWF is commonly used in the wastewater industry to calculate capacity share within sewer facilities because peak factors curves are not accurate at low flow rates and it becomes difficult to agree on the exact flow rate to use for calculating the proportionate share. ADWF, on the other hand, is more easily calculated and accurate. ADWF is typically used in wastewater capacity agreements and is the basis for determining treatment capacity with the City of Palo Alto.

Sewer Mains indicated in **red** are hydraulically deficient in 2030 model scenario with inclusion of the SACII project.

* Sewer Mains were recommended for upsizing in the City's General Plan Update Utility Impact Study

Ultimate (2030) ADWF with redevelopment was analyzed with the City's sewer system CIP

Remaining diameter increases recommended for continuity purposes.

BACKGROUND

The proposed project is located at 391/377/405 San Antonio Road, on Assessor's Parcel Numbers (APN) 148-22-002, -003, -004, and -008, southeast of the intersection of California Avenue and San Antonio Road at the San Antonio Shopping Center in City of Mountain View, Santa Clara County, California. The project, which is the second phase of the San Antonio Village Center Project, proposed mixed-use development including office, commercial, retail, hotel, cinema, restaurant, and parking on a 9.9-acre site at the existing San Antonio Shopping Center. The project proposed to develop 392,855 square feet [sq. ft.] of office use space, 82,690 sq. ft. of commercial and retail use space, 142,085 sq. ft. with 167 rooms of hotel use space, 35,360 sq. ft. of restaurant use space, and 67,280 sq. ft. with 1,710 seats of cinema use space. The site area is shown on Figure 1.

As the proposed project may potentially impact the water and sewer facilities in the area, ICF International has requested that IEC prepare a water and sewer utility impact study for the project parcels that evaluates the incremental impact on the recently developed Capital Improvement Program (CIP) for the City of Mountain View, previously developed by IEC during the General Plan Update Utility Impact Study (GPUUIS) in October 2011.

This technical memorandum analyzes the water and sanitary sewer impacts of the SACII project in detail. This analysis requires an examination of the infrastructure, fire-flow requirements and sanitary sewer flows from the project area downstream through the gravity sewer system to the Los Altos wastewater collection system.

WATER SYSTEM IMPACT

This report assumes that fire, domestic and irrigation services for the SACII project parcels are currently served by 10” water line in California Ave and 12” water line in San Antonio Road. The incremental difference in water demand with the SACII project is 0.1488 mgd greater than the existing (2010) water demand and 0.1297 mgd greater than the 2030 GPUUIS projections. Tables 1 and 2 show the existing (2010) water demands on the project parcels and the projected ultimate (2030) demands given the GPUUIS (without the proposed project), respectively. The ultimate water demand with the proposed development is shown in Table 3 along with the incremental differences.

Water demands for the parcels are based upon the increase in non-residential density, however, domestic water demands rarely drive the sizing of a water distribution system, as fire flow requirements are typically 30 to 40 times average and peak domestic water demands. Consequently, the parcel’s fire flow was analyzed to detect impacts to the water system. The project parcels’ existing zoning of Planned Community (P) with General Plan land use designation of Mixed Use Center (C/R-C) requires fire flow rate of 5,000 gpm. There is no change in the project parcels’ zoning with redevelopment, therefore, there will be no change in fire flow and therefore no incremental impact of the City’s current water system CIP.

SANITARY SEWER STUDY AREA

The specific area of concern is the gravity sewer system from the SACII project area, downstream to an outfall to the Los Altos sewer main and the potential impact of sewage discharge on the contractual limitation per the Los Altos 1970 Sewer Agreement. In order to accurately calculate sanitary sewer flows in this study, the SACII project and the flows contributed from surrounding parcels to Alma Recorder are chosen as the study area. This report assumes the developer of the SACII project will connect to existing manholes F1-056 on California Ave with installation of new sewer laterals and sewer main, and F1-019 on San Antonio Road with replacement of existing sewer laterals. Since the preliminary utility plan has not yet been approved, the study may need to be amended if the design changes. All sanitary sewer mains examined for the study area can be seen in Figure 1 and Figure 4.

HYDRAULIC MODEL

As part of the City's Sewer System Master Plan (SSMP) preformed in August 2010, IEC developed an InfoSWMM sewer system hydraulic model from the sewer system GIS database. This platform combines a fully dynamic hydraulic modeling engine developed and approved by the Environmental Protection Agency (EPA) with the GIS interface that can take advantage of the data that the City has built into its sewer system GIS database.

SANITARY SEWER FLOWS

The calculation of the impacts to the sanitary sewer flows from the SACII project requires the establishment of baseline sewer flows and hydraulic capacities in the sanitary sewer system. Flow for the SACII project was calculated as defined in the City's GPUUIS and added to the GPUUIS baseline sewer flows for comparison. For the purposes of this study, existing and ultimate average dry weather sewer flows (ADWF) for the sanitary sewer were calculated per the methods described in the City's GPUUIS. Peak dry weather sewer flow (PDWF) and peak wet weather sewer flow (PWWF) were calculated by application of the peak curves developed in the SSMP as well.

ADWF Before Developments

Existing ADWF was calculated using parcel-level existing sewer flows as described in the SSMP and includes constant base infiltration (BI). Ultimate sewer flows were calculated by applying parcel-level duty factors to all parcels in the system as described in the GPUUIS.

PDWF Before Developments

PDWF for the study area was calculated by applying either the Residential or Non-Residential Diurnal Demand Curve, from the SSMP, to the respective categorized flows. These curves can be seen in Figure 2 and Figure 3. Constant BI sewer flows were included in the PDWF.

PWWF Before Developments

The PWWF for the study area was calculated by applying either the Residential or Non-Residential Diurnal Demand Curve from the SSMP to the respective categorized sewer flows. These curves can be seen in Figure 2 and Figure 3. BI and rain dependent infiltration/inflow (RDI/I) sewer flows were also included, but not peaked per the SSMP.

ADWF Including Developments

ADWF for the SACII project was calculated per the methods described in the GPUUIS. Table 4 shows the existing (2010) sewer flow at the project parcels using sewer generation rates from Table 3-2 of the *Sewer Master Plan of City of Mountain View*. ICF provided that the project will consist of 392,855 sq. ft. office use space, 82,690 sq. ft. commercial and retail use space, 142,085 sq. ft. with 167 rooms of hotel use space, 35,360 sq. ft. of restaurant use space, and 67,280 sq. ft. with 1,710 seats of cinema use space. The ultimate flow based on the original GPUUIS zoning using sewer generation rates of Table 2-2 of GPUUIS can be seen in Table 5. Sewer generation rates from Table 2-2 of GPUUIS and Exhibit. M2-12 of the *L.A. Thresholds Guide* were used to calculate the ultimate flow with proposed project, which can be seen in Table 6 with incremental differences. Assuming sewer flow from the two westerly buildings of the proposed project is directed into manhole F1-019 on San Antonio Road, the rest is directed into manhole F1-056 on California Ave. sewer flows would increase 0.1203 mgd from the existing 2010 sewer flows and 0.1046 mgd from the 2030 GPUUIS projections.

PDWF Including Developments

PDWF for the study area, including the SACII project, was calculated by applying either the Residential or Non-Residential Diurnal Demand Curve, from the SSMP, to the respective categorized flows. These curves can be seen in Figure 2 and Figure 3. Constant BI sewer flows were included in the PDWF.

PWWF Including Developments

The PWWF including the SACII project was calculated by applying either the Residential or Non-Residential Diurnal Demand Curve from the SSMP to the respective categorized flows. These curves can be seen in Figure 2 and Figure 3. BI and RDI/I sewer flows were also included, but not peaked per the SSMP.

LOS ALTOS 1970 SEWER AGREEMENT

According to the Los Altos 1970 Sewer Agreement, City of Los Altos agrees to receive two million gallons per day of maximum peak flow rate of sanitary sewage from the City at a portion of Los Altos' San Antonio Interceptor Sewer between Central Expressway (formally Alma Street) and the Joint System metering station. Parcels which sewer connects to Los Altos' San Antonio Interceptor Sewer between Central Expressway and the Joint System metering station are defined

as the Alma Recorder Area, as shown in Figure 5. ADWF and PWWF of Alma Recorder Area with and without the SACII project are compared with the flow contractual limitation. ADWF is calculated using parcel-level sewer flows within the Alma Recorder Area with or without SACII project, and PWWF is calculated by applying either residential or non-residential diurnal demand curve to the respective categorized ADWF within inclusion of BI and rain dependent infiltration/inflow.

Table 7 shows the sewer generation factors used in the calculation and Table 8 shows the total ADWF and PWWF of Alma Recorder Area with and without SACII project. Under all scenarios, sewer flow contributed from the Alma Recorder Area with and without SACII project are below the contractual limitation of two million gallons per day of PWWF. There are 3% and 1% of sewer capacity remaining to Los Altos' San Antonio Interceptor Sewer for ultimate (2030) flow with and without proposed project, respectively.

SANITARY SEWER HYDRAULIC MODEL

Design Criteria

The following design criteria, as described in the GPUUIS, were used in this analysis:

- Pipes 12-inches in diameter and smaller: $\frac{1}{2}$ full at peak wet weather flow
- Pipes over 12-inches in diameter: $\frac{3}{4}$ full at peak wet weather flow
- Minimum velocity: 2 feet per second (1/2 full or full)
- Maximum velocity: 10 feet per second
- Manning's n: .013

Model Results

The SACII project will contribute an incremental flow of 0.1046 mgd, as the existing flow on the parcels has been accounted for in the City's GPUUIS. With this incremental increase, 11 pipes require upsizing for hydraulic and continuity criteria. Table 9 through Table 12 show the maximum flow in each pipeline of the study area, for Existing flow (2010) without and with SACII project contribution, and Ultimate (2030) flow without and with SACII project contribution. Hydraulic model for existing flow conditions are calibrated using sewer monitoring data in 2007 as described in 2010 SMP. Model for existing flow conditions runs with existing diameter, and model for future flow conditions runs with diameters proposed in GPUUIS.

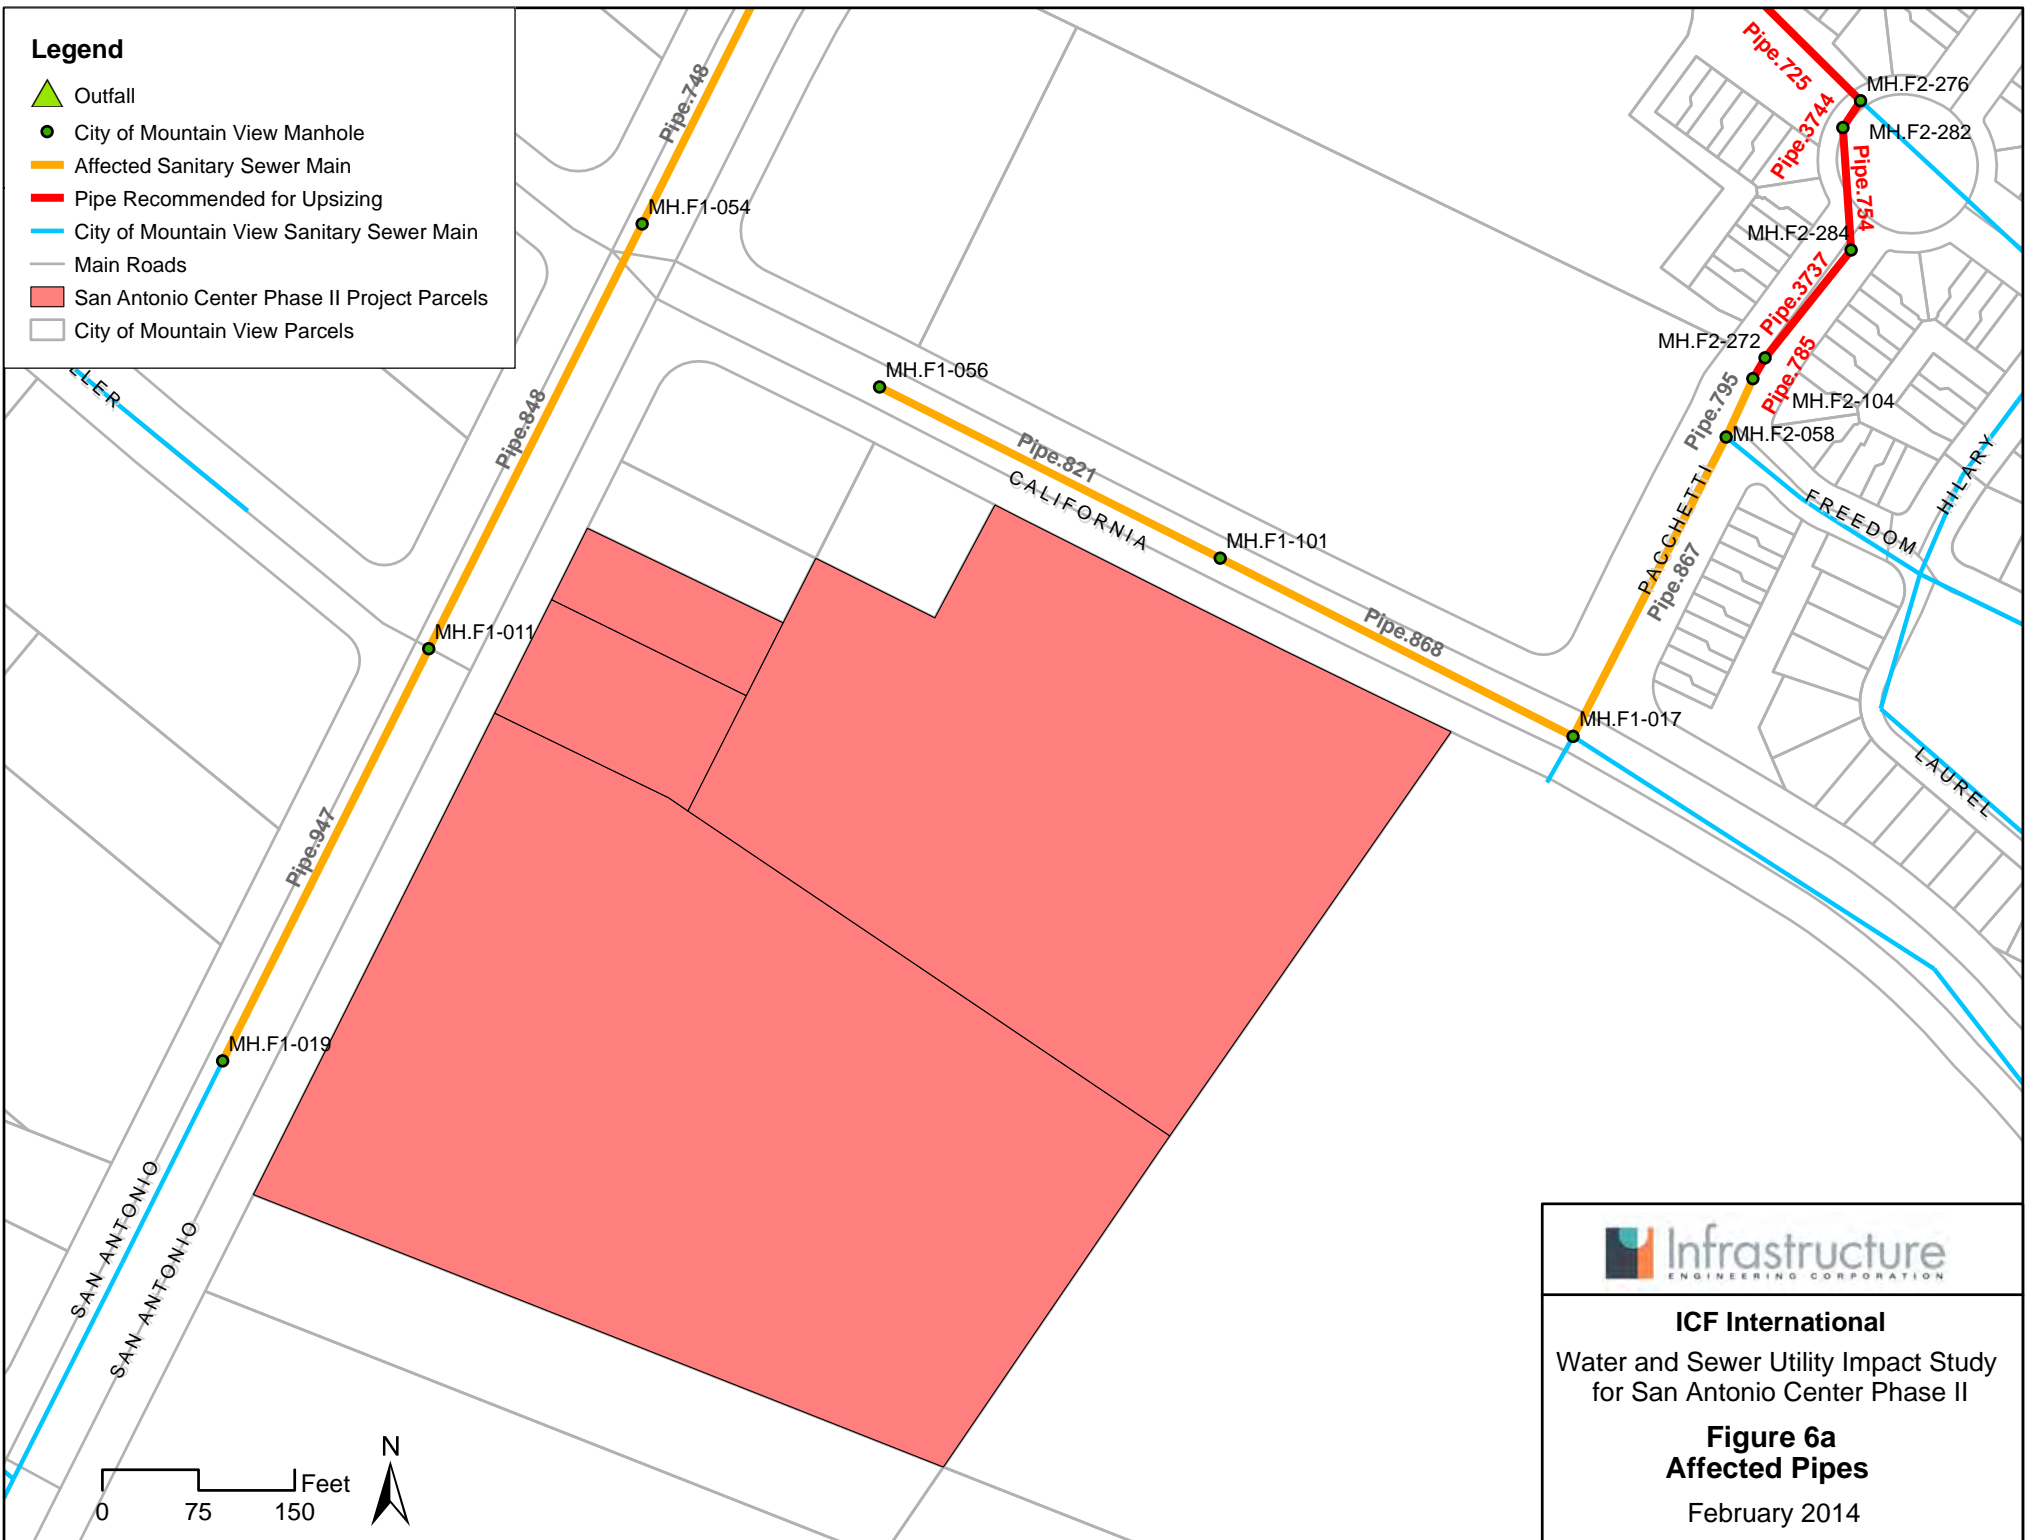

Because the City's design criteria are based upon PWWF, the comparison of PWWF results for all scenarios can be seen in Table 13. Table ES-1 shows the pipes that failed to meet the City's hydraulic and continuity criteria with recommended diameter increases and the percentage of contributed flow each agency is responsible for. There are 11 pipe segments that are currently or will exceed capacity according to the City's design criteria. Three pipe segments are recommended for upsizing in order to meet the hydraulic and continuity criteria in addition to the eight pipes which have been recommended for upsizing in GPUUIS. Recommended diameter increase of pipe No. 3717 in GPUUIS is not sufficient with the proposed project, so larger diameter increase is recommended.

The proportionate share of flow in the ultimate facilities is based on Ultimate (2030) ADWF per "industry standard" cost sharing methodologies. ADWF is commonly used in the wastewater industry to calculate capacity share within sewer facilities because peak factors curves are not accurate at low flow rates and it becomes difficult to agree on the exact flow rate to use for calculating the proportionate share. ADWF, on the other hand, is more easily calculated and accurate. ADWF is typically used in wastewater capacity agreements and is the basis for determining treatment capacity with the City of Palo Alto.

Figure 6a-6b show the pipeline analyzed.

Appendix M
Conditions of Approval

City of Mountain View

Conditions of Approval

The Village at San Antonio Center Phase II Project

PL-85 [NOISE]

CONSTRUCTION NOISE REDUCTION: The following noise reduction measures shall be incorporated into construction plans and contractor specifications to reduce the impact of temporary construction-related noise on nearby properties: (a) comply with manufacturer's muffler requirements on all construction equipment engines; (b) turn off construction equipment when not in use, where applicable; (c) locate stationary equipment as far as practical from receiving properties; (d) use temporary sound barriers or sound curtains around loud stationary equipment if the other noise reduction methods are not effective or possible; and (e) shroud or shield impact tools and use electric-powered rather than diesel-powered construction equipment.

PL-86 [NOISE]

SITE-SPECIFIC BUILDING ACOUSTICAL ANALYSIS: A qualified acoustical consultant will review final site plans, building elevations, and floor plans prior to construction to calculate expected interior noise levels as required by State noise regulations. Project-specific acoustical analyses are required by the California Building Code to confirm that the design results in interior noise levels reduced to 45 dBAL_{dn} or lower. The specific determination of what noise insulation treatments are necessary will be completed on a unit-by-unit basis. Results of the analysis, including the description of the necessary noise control treatments, will be submitted to the City along with the building plans, and approved prior to issuance of a building permit. Building sound insulation requirements will include the provision of forced-air mechanical ventilation for all residential units as recommended by the qualified acoustical consultant, so that windows can be kept closed at the occupant's discretion to control noise.

Special building techniques (e.g., sound-rated windows and building facade treatments) will be implemented as recommended by the qualified acoustical consultant, to maintain interior noise levels at or below acceptable levels. These treatments will include, but are not limited to, sound-rated windows and doors, sound-rated wall construction, acoustical caulking, protected ventilation openings, etc.

PL-94 [CONSTRUCTION PRACTICES AND NOTICING]

BASIC AIR QUALITY CONSTRUCTION MEASURES: The applicant shall require all construction contractors to implement the basic construction mitigation measures recommended by the BAAQMD to reduce fugitive dust emissions. Emission reduction measures will include, at a minimum, the following measures. Additional measures may be identified by the BAAQMD or contractor as appropriate: (a) all exposed surfaces (e.g., parking areas, staging areas, soil piles, graded areas, and unpaved access roads) will be watered two times per day; (b) all haul trucks transporting soil, sand, or other loose material offsite will be covered; (c) all visible mud or dirt track-out onto adjacent public roads will be removed using wet power vacuum street sweepers at least once per day. The use of dry power sweeping is prohibited; (d) all vehicle speeds on unpaved roads will be limited to 15 mph; (e) all roadways, driveways, and sidewalks to be paved will be completed as soon as possible. Building pads will be laid as soon as possible after grading unless seeding or soil binders are used; and (f) post a publicly visible sign with the telephone number and person

to contact at the lead agency regarding dust complaints. This person will respond and take corrective action within 48 hours. The BAAQMD's phone number will also be visible to ensure compliance with applicable regulations.

PL-95 [CONSTRUCTION PRACTICES AND NOTICING]

DISCOVERY OF CONTAMINATED SOILS: If contaminated soils are discovered, the applicant will ensure the contractor employs engineering controls and Best Management Practices (BMPs) to minimize human exposure to potential contaminants. Engineering controls and construction BMPs will include, but not be limited to, the following: (a) contractor employees working on-site will be certified in OSHA's 40-hour Hazardous Waste Operations and Emergency Response (HAZWOPER) training; (b) contractor will stockpile soil during redevelopment activities to allow for proper characterization and evaluation of disposal options; (c) contractor will monitor area around construction site for fugitive vapor emissions with appropriate field screening instrumentation; (d) contractor will water/mist soil as it is being excavated and loaded onto transportation trucks; (e) contractor will place any stockpiled soil in areas shielded from prevailing winds; and (f) contractor will cover the bottom of excavated areas with sheeting when work is not being performed.

PL-96 [CONSTRUCTION PRACTICES AND NOTICING]

DISCOVERY OF ARCHAEOLOGICAL RESOURCES: If prehistoric or historic-period cultural materials are unearthed during ground-disturbing activities, it is recommended that all work within 100' of the find be halted until a qualified archaeologist and Native American representative can assess the significance of the find. Prehistoric materials might include obsidian and chert flaked-stone tools (e.g., projectile points, knives, scrapers) or tool-making debris; culturally darkened soil ("midden") containing heat-affected rocks and artifacts; stone milling equipment (e.g., mortars, pestles, handstones, or milling slabs); and battered-stone tools, such as hammerstones and pitted stones. Historic-period materials might include stone, concrete, or adobe footings and walls; filled wells or privies; and deposits of metal, glass, and/or ceramic refuse. If the find is determined to be potentially significant, the archaeologist, in consultation with the Native American representative, will develop a treatment plan that could include site avoidance, capping, or data recovery.

PL-97 [CONSTRUCTION PRACTICES AND NOTICING]

DISCOVERY OF HUMAN REMAINS: In the event of the discovery of human remains during construction or demolition, there shall be no further excavation or disturbance of the site within a 50' radius of the location of such discovery, or any nearby area reasonably suspected to overlie adjacent remains. The Santa Clara County Coroner shall be notified and shall make a determination as to whether the remains are Native American. If the Coroner determines that the remains are not subject to his/her authority, he/she shall notify the Native American Heritage Commission, which shall attempt to identify descendants of the deceased Native American. If no satisfactory agreement can be reached as to the disposition of the remains pursuant to this State law, then the landowner shall reinter the human remains and items associated with Native American burials on the property in a location not subject to further subsurface disturbance. A final report shall be submitted to the City's Community Development Director prior to release of a Certificate of Occupancy. This report shall contain a description of the mitigation programs and its results, including a description of the monitoring and testing resources analysis methodology and conclusions, and a description of the disposition/curation of the resources. The report shall verify completion of the mitigation program to the satisfaction of the City's Community Development Director.

PL-98 [CONSTRUCTION PRACTICES AND NOTICING]

PRECONSTRUCTION NESTING BIRD SURVEY: To the extent practicable, vegetation removal and construction activities shall be performed from September 1 through January 31 to avoid the general nesting period for birds. If construction or vegetation removal cannot be performed during this period, preconstruction surveys will be performed no more than two days prior to construction activities to locate any active nests as follows.

The applicant shall be responsible for the retention of a qualified biologist to conduct a survey of the project site and surrounding 500' or active nests-with particular emphasis on nests of migratory birds if construction (including site preparation) will begin during the bird nesting season, from February 1 through August 31. If active nests are observed on either the project site or the surrounding area, the project applicant, in coordination with the appropriate City staff, shall establish no-disturbance buffer zones around the nests, with the size to be determined in consultation with the California Department of Fish and Game (usually 100' for perching birds and 300' for raptors). The no-disturbance buffer will remain in place until the biologist determines the nest is no longer active or the nesting season ends. If construction ceases for two days or more and then resumes during the nesting season, an additional survey will be necessary to avoid impacts on active bird nests that may be present.

PL-99 [TECHNICAL REPORTS]

GEOTECHNICAL REPORT: The applicant shall have a design-level geotechnical investigation prepared which includes recommendations to address and mitigate geologic hazards in accordance with the specifications of CGS Special Publication 117, Guidelines for Evaluating and Mitigating Seismic Hazards, and the requirements of the Seismic Hazards Mapping Act. The report will be submitted to the City prior to the issuance of building permits, and the recommendations made in the geotechnical report will be implemented as part of the project. Recommendations may include considerations for design of permanent below-grade walls to resist static lateral earth pressures, lateral pressures caused by seismic activity, and traffic loads; method for backdraining walls to prevent the buildup of hydrostatic pressure; considerations for design of excavation shoring system; excavation monitoring; and seismic design.
